Introduction

The World at the beginning of the 21st Century would be a place of unimaginable change to our forefathers. Since 1900 the human population has undergone a fourfold growth coupled with an unparalleled development in the technology at our disposal. The last vestiges of the unknown World are gone, and previously hostile realms claimed for habitation. The advent of aviation technology and the growth of mass tourism have allowed people to travel further and more frequently than ever before

Allied to this, the rapid growth of global communication systems mean that World events have become more accessible than ever before and their knock on effects quickly ripple across the whole planet. News broadcasts bring the far-flung corners of the world into everyone's lives, and with it, a view of the people and places that make up that region. The mysteries of the World that once fueled global exploration and the quest to discover the unknown are behind us; we inhabit a world of mass transportation, a world where even the most extreme regions have been mapped, a world with multi faceted view points on every event, a World of communication overload.

However, does this help us make sense of the World? It is increasingly important for us to have a clear vision of the World in which we live and such a deluge of information can leave us struggling to find some context and meaning. It has never been more important to own an atlas; the *DK Complete Atlas of the World* has been conceived to meet this need. At its core, like all atlases, it seeks to define where places are, to describe their main characteristics, and to locate them in relation to other places. By gathering a spectacular collection of satellite imagery and draping it with carefully selected and up-to-date geographic information this atlas filters the World's data into clear, meaningful and user-friendly maps.

The World works on different levels and so does the *DK Complete Atlas of the World*. Readers can learn about global issues of many kinds or they can probe in a little further for the continental context. Delving even further they can explore at regional, national or even sub-national level. The very best available satellite data has been used to create topography and bathymetry that reveal the breathtaking texture of landscapes and sea-floors. These bring out the context of the places and features selected to appear on top of them.

This second edition of the *DK Complete Atlas of the World* incorporates hundreds of revisions and updates affecting every map and every page, distilling the burgeoning mass of information available through modern technology into an extraordinarily detailed and reliable view of our World.

Contents

The atlas is organized by continent, moving eastward from the International Date Line. The opening section describes the world's structure, systems and its main features. The Atlas of the World which follows, is a continent-by-continent guide to today's world, starting with a comprehensive insight into the physical, political, and economic structure of each continent, followed by detailed maps of carefully selected geopolitical regions.

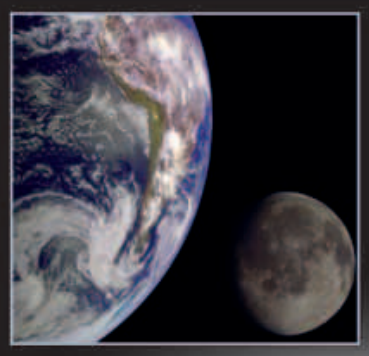
The Solar System

The Solar System consists of our local star, the Sun, and numerous objects that orbit the Sun – eight planets, five currently recognized dwarf planets, over 165 moons orbiting these planets and dwarf planets, and countless smaller bodies such as comets and asteroids. Including a vast outer region that is populated only by comets, the Solar System is about 9,300 billion miles (15,000 billion km) across. The much smaller region containing just the Sun and planets is about 7.5 billion miles (12 billion km) across. The Sun, which contributes over 99 percent of the mass of the entire Solar System, creates energy from nuclear reactions deep within its interior, providing the heat and light that make life on Earth possible.

THE MOON'S PHASES

As the Moon orbits Earth, the relative positions of Moon, Sun and Earth continuously change. Thus, the angle at which the Moon's sunlit face is seen by an observer on Earth varies in a cyclical fashion, producing the Moon's phases, as shown at right. Each cycle takes 29.5 days.

1. WAXING CRESCENT
2. FIRST QUARTER



The Earth and Moon's relative sizes are clear in this long-range image from space.

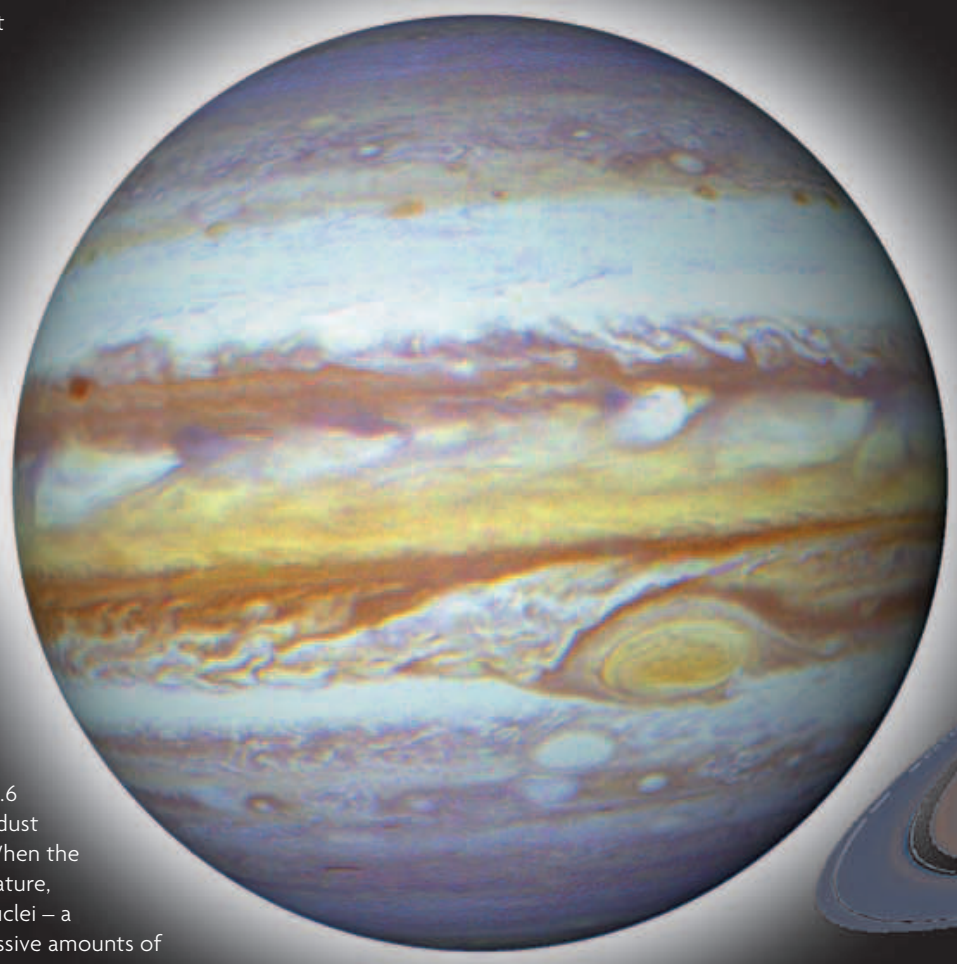
The Moon

Earth's only satellite, the Moon, is thought to have formed 4.5 billion years ago from a cloud of debris produced when a large asteroid hit the young Earth. The Moon is too small to have retained an atmosphere, and is therefore a lifeless, dusty and dead world. However, although the Moon has only about 1 percent of the mass of the Earth, its gravity exerts an important influence on Earth's oceans, manifest in the ebb and flow of the tides.

What is a Planet?

The International Astronomical Union defines a Solar System planet as a near-spherical object that orbits the Sun (and no other body) and has cleared the neighborhood around its orbit of other bodies. A dwarf planet is a planet that is not big enough to have cleared its orbital neighborhood. Extra-solar planets are objects orbiting stars other than the Sun.

MERCURY VENUS EARTH MARS CERES (dwarf planet)



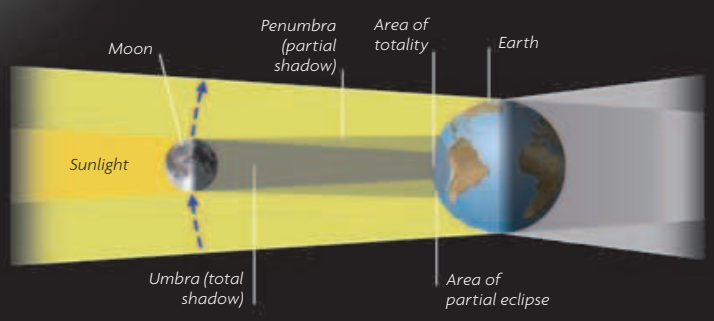
JUPITER

The Sun

The Sun is a huge sphere of exceedingly hot plasma (ionized gas), consisting mainly of the elements hydrogen and helium. It formed about 4.6 billion years ago, when a swirling cloud of gas and dust began to contract under the influence of gravity. When the center of this cloud reached a critically high temperature, hydrogen nuclei started combining to form helium nuclei – a process called nuclear fusion – with the release of massive amounts of energy. This process continues to this day.

SOLAR ECLIPSE

A solar eclipse occurs when the Moon passes between Earth and the Sun, casting its shadow on Earth's surface. During a total eclipse *(below)*, viewers along a strip of Earth's surface, called the area of totality, see the Sun totally blotted out for a short time, as the umbra (Moon's full shadow) sweeps over them. Outside this area is a larger one, where the Sun appears only partly obscured, as the penumbra (partial shadow) passes over.



INSIDE THE SUN

The Sun has three internal layers. At its center is the core, where temperatures reach 27 million°F (15 million°C) and nuclear fusion occurs. The radiative zone is a slightly cooler region through which energy radiates away from the core. Further out, in the convective zone, plumes of hot plasma carry the energy towards the Sun's visible surface layer, called the photosphere. Once there, the energy escapes as light, heat and other forms of radiation.

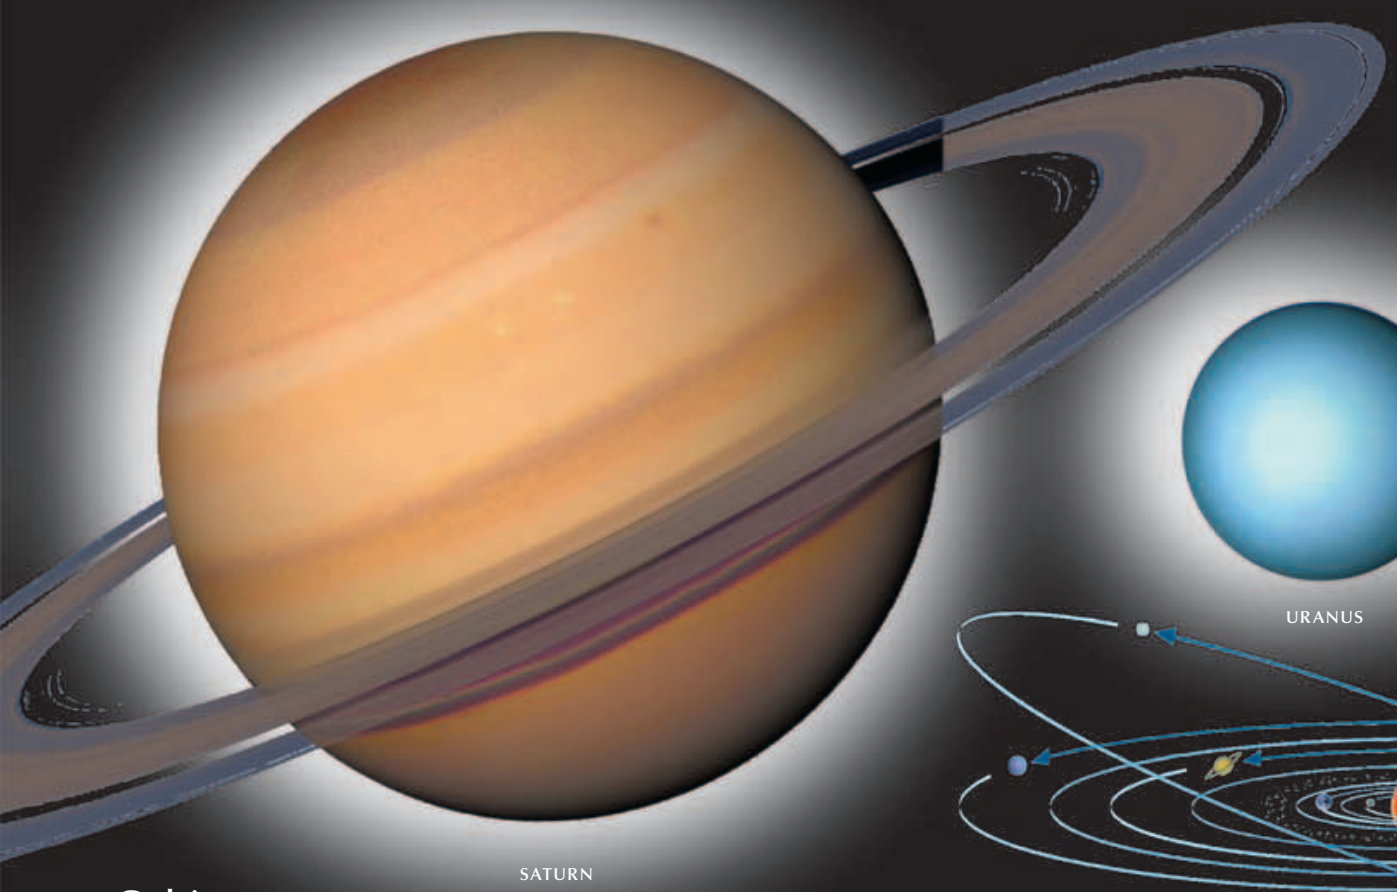
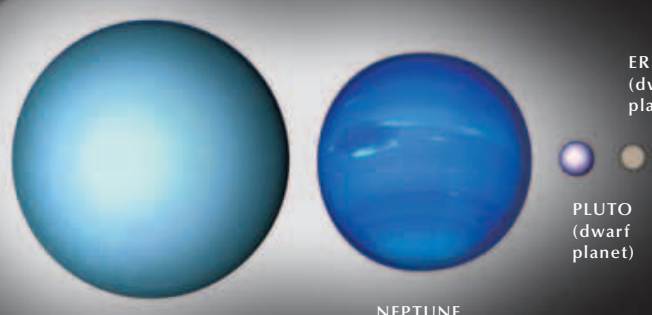
DWARF PLANETS

In 2006 a new type of dwarf planet was defined in an attempt to classify the numerous smaller bodies within the solar system that behave like planets physically but which are only a fraction of the size of the major planets. Currently, there are five dwarf planets recognized under this new system, Ceres, Pluto, Haumea, Makemake, and Eris.



SATURN

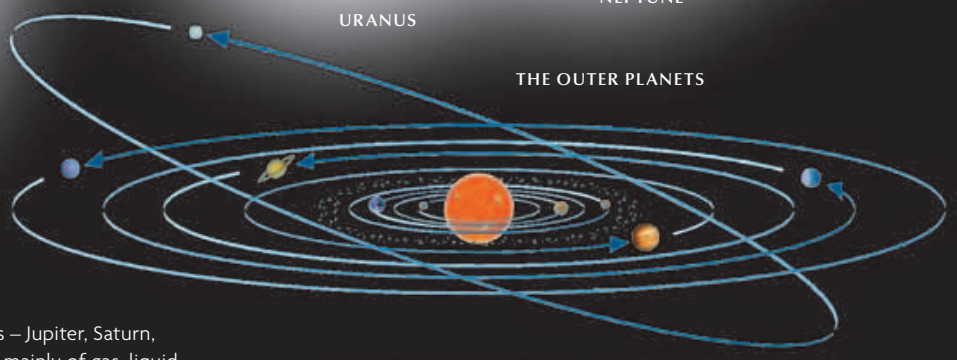


ERIS (dwarf planet)

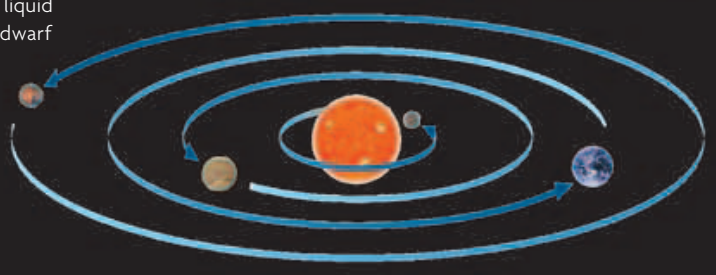
PLUTO (dwarf planet)

NEPTUNE

URANUS



THE OUTER PLANETS



THE INNER PLANETS

Orbits

All the Solar System's planets and dwarf planets orbit the Sun in the same direction and (apart from Pluto) roughly in the same plane. All the orbits have the shapes of ellipses (stretched circles). However in most cases, these ellipses are close to being circular: only Pluto and Eris have very elliptical orbits. Orbital period (the time it takes an object to orbit the Sun) increases with distance from the Sun. The more remote objects not only have further to travel with each orbit, they also move more slowly.

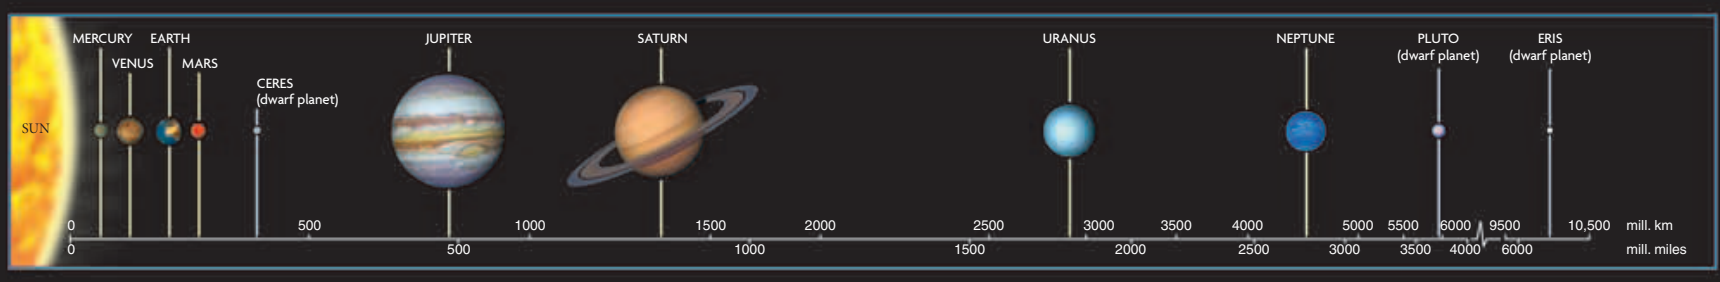
THE OUTER PLANETS

The four gigantic outer planets – Jupiter, Saturn, Uranus and Neptune – consist mainly of gas, liquid and ice. All have rings and many moons. The dwarf planet Pluto is made of rock and ice.

THE INNER PLANETS

The four planets closest to the Sun – Mercury, Venus, Earth and Mars – are composed mainly of rock and metal. They are much smaller than the outer planets, have few or no moons, and no rings.

AVERAGE DISTANCE FROM THE SUN



The Physical World

Earth's surface is constantly being transformed. Movements of the rigid tectonic plates that make up this surface are continuously, if slowly, shifting its landmasses around, while the land itself is constantly weathered and eroded by wind, water, and ice. Sometimes change is dramatic, the spectacular results of earthquakes or floods. More often it is a slow process lasting for millions of years. A physical map of the world represents a snapshot of Earth's ever-evolving architecture. The terrain maps below and at right show the planet's whole surface, including variations in ocean depth as well as the mountain-rippled texture of Earth's continents.

THE WORLD'S OCEANS

Earth's surface is dominated by water. The hemisphere shown here, centered around the southwest Pacific, is nearly all ocean, with the waters interrupted only by Antarctica, a part of South America, Australia, and the numerous islands of Australasia & Oceania, and southeast Asia.

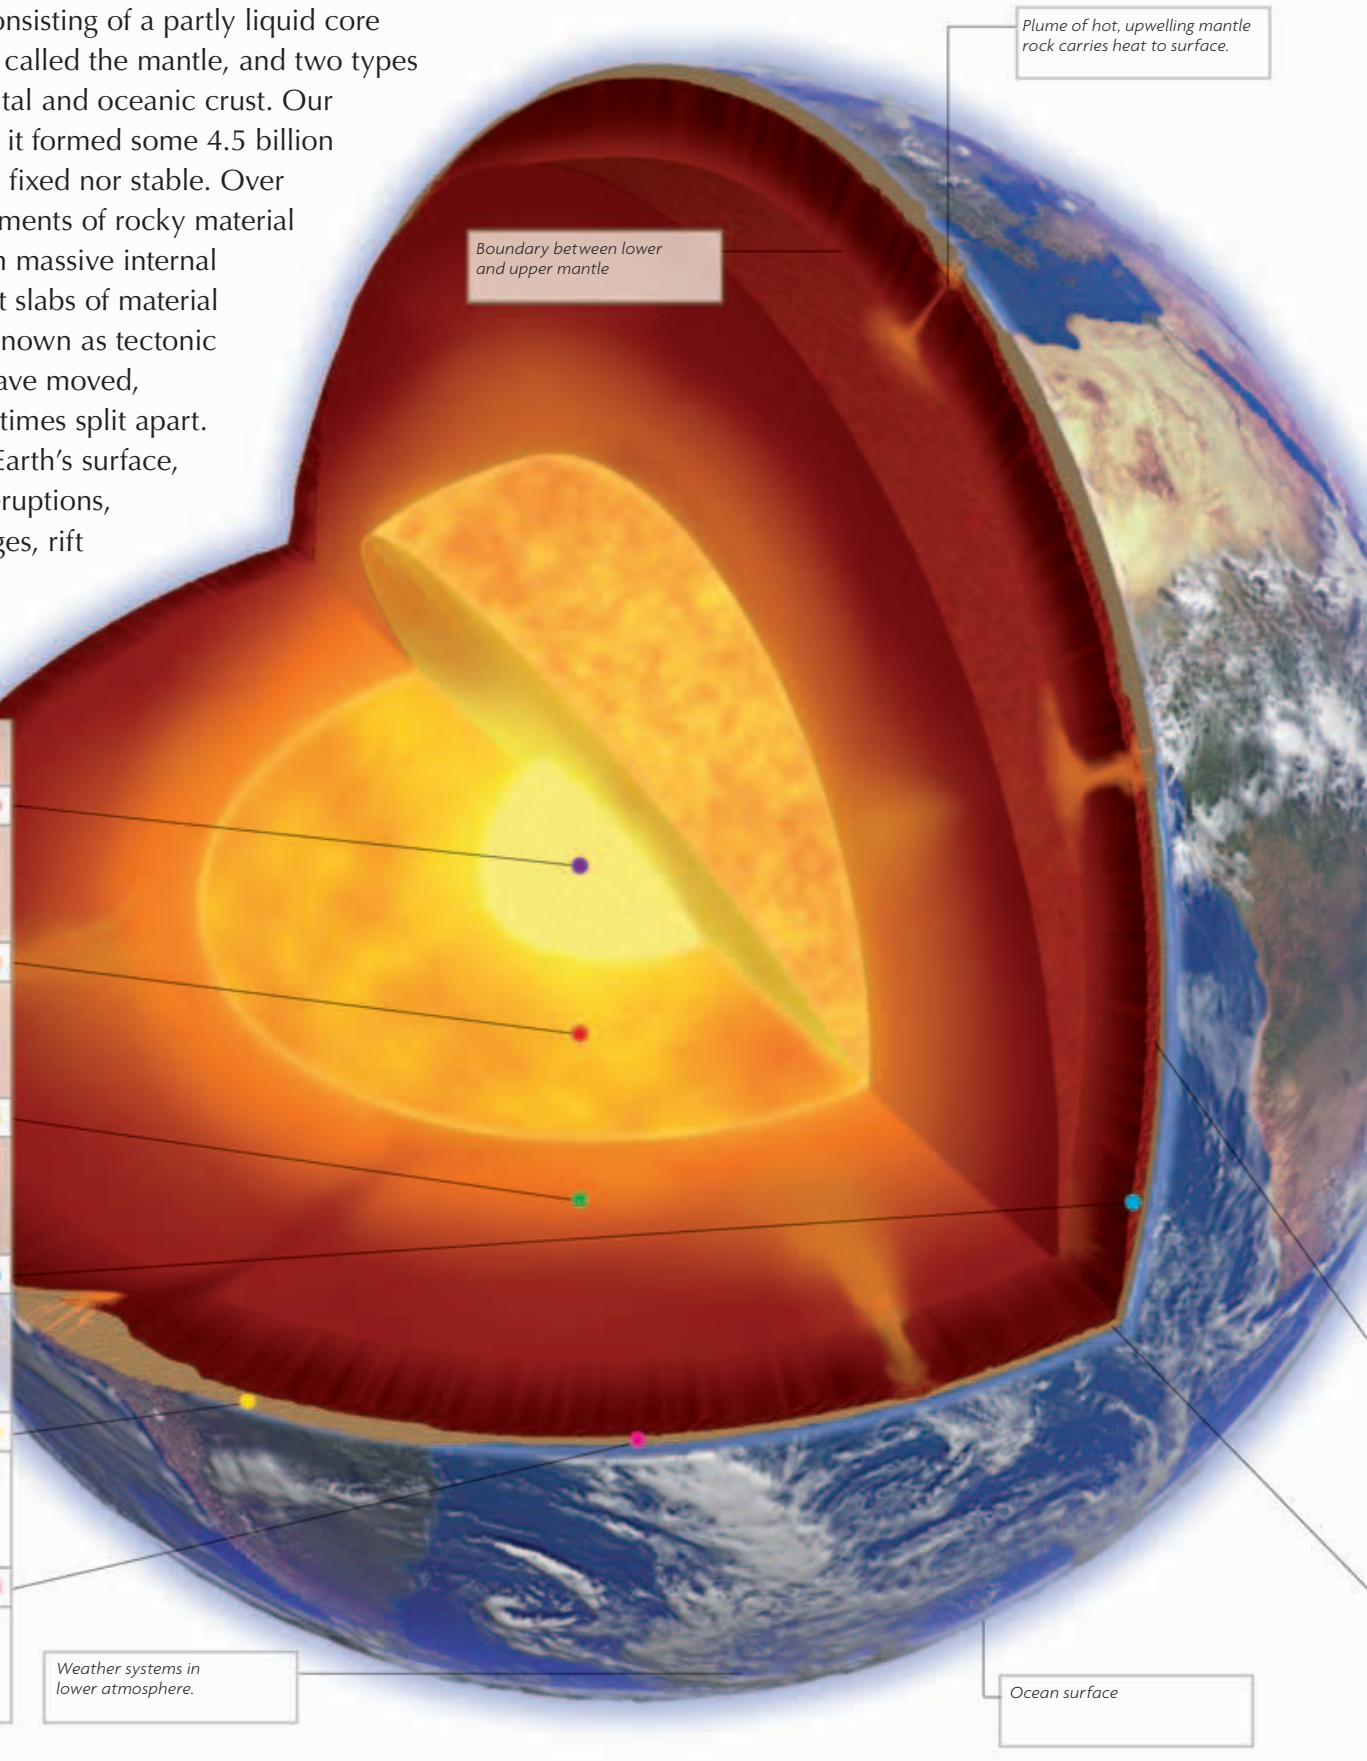
SURFACE AREA OF LAND: 57.5 million sq miles (149 million sq km)	

THE WORLD'S LAND

Most of the world's land is concentrated in a hemisphere centered around Europe. This concentration was even greater before tectonic movement opened up the Atlantic, splitting the Americas from Europe and Africa, some 170 million years ago.

The Structure of the Earth

Earth is an almost perfect sphere consisting of a partly liquid core overlain by a deep, semisolid layer, called the mantle, and two types of surface crust, known as continental and oceanic crust. Our planet has constantly evolved since it formed some 4.5 billion years ago. Its continents are neither fixed nor stable. Over the course of history, gradual movements of rocky material within Earth's mantle, resulting from massive internal flows of heat, have caused the great slabs of material that make up the planet's surface, known as tectonic plates, to shift around. The plates have moved, collided, joined together, and sometimes split apart. These processes continue to mold Earth's surface, causing earthquakes and volcanic eruptions, and creating oceans, mountain ranges, rift valleys, deep ocean trenches, and island chains.



EARTH FACTS & FIGURES

INNER CORE

COMPOSITION: Solid iron, with some nickel
DENSITY: 7.0 oz/in³ (12 g/cm³)
DEPTH: 3200-3963 miles (5150-6378 km) below surface
TEMPERATURE: 7200–8500°F (4000–4700°C)

OUTER CORE

COMPOSITION: Liquid iron and nickel
DENSITY: 5.7 oz/in³ (10 g/cm³)
DEPTH: 1907-3200 miles (2990-5150 km) below surface
TEMPERATURE: 6300–7200°F (3500–4000°C)

LOWER MANTLE

COMPOSITION: Semisolid high-density silicates
DENSITY: 3.2 oz/in³ (5.5 g/cm³)
DEPTH: 48-1907 miles (75-2990 km) below surface
TEMPERATURE: 1800–6300°F (1000–3500°C)

UPPER MANTLE

COMPOSITION: Semisolid rock, primarily peridotite
DENSITY: 2.0 oz/in³ (3.5 g/cm³)
DEPTH: 3–48 miles (5–75 km) below surface
TEMPERATURE: 1800°F (Less than 1000°C)

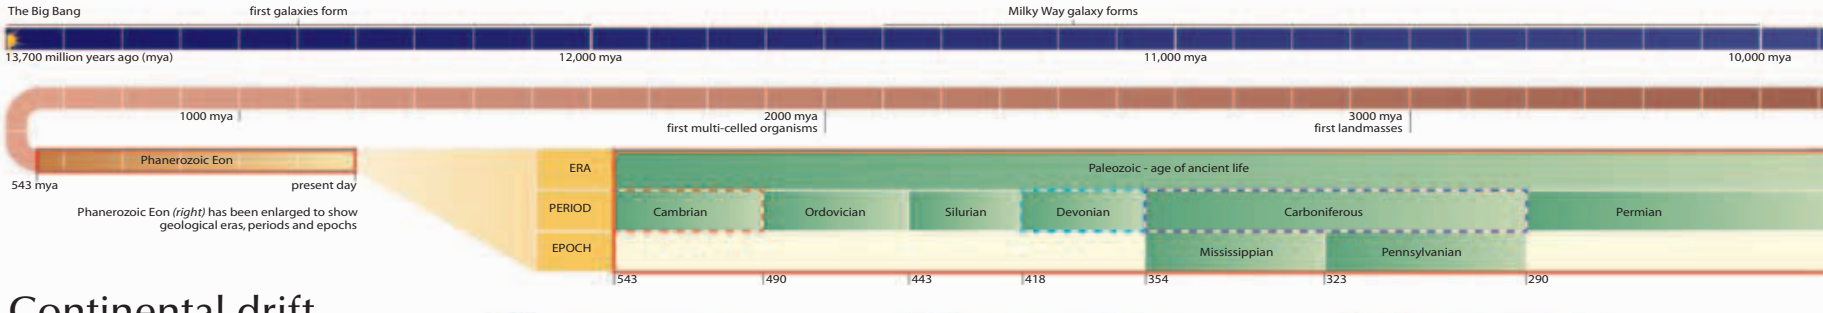
CONTINENTAL CRUST

COMPOSITION: Solid, relatively light rock such as granite
DENSITY: 1.6 oz/in³ (2.7 g/cm³)
DEPTH: 0–48 miles (0–75 km) below surface
TEMPERATURE: 1800°F (Less than 1000°C)

OCEANIC CRUST

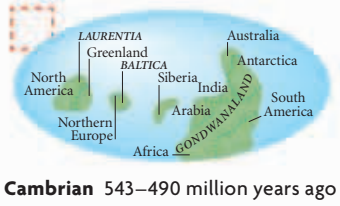
COMPOSITION: Solid, relatively dense basaltic lava
DENSITY: 1.7 oz/in³ (3 g/cm³)
DEPTH: 2–7 miles (3–11 km) below surface
TEMPERATURE: 1800°F (Less than 1000°C)

FROM THE BIG BANG TO THE PRESENT DAY



Continental drift

Although Earth's tectonic plates move only a few inches (centimeters) each year, over hundreds of millions of years, its landmasses have moved many thousands of miles (kilometers), to create new continents, oceans, and mountain chains.



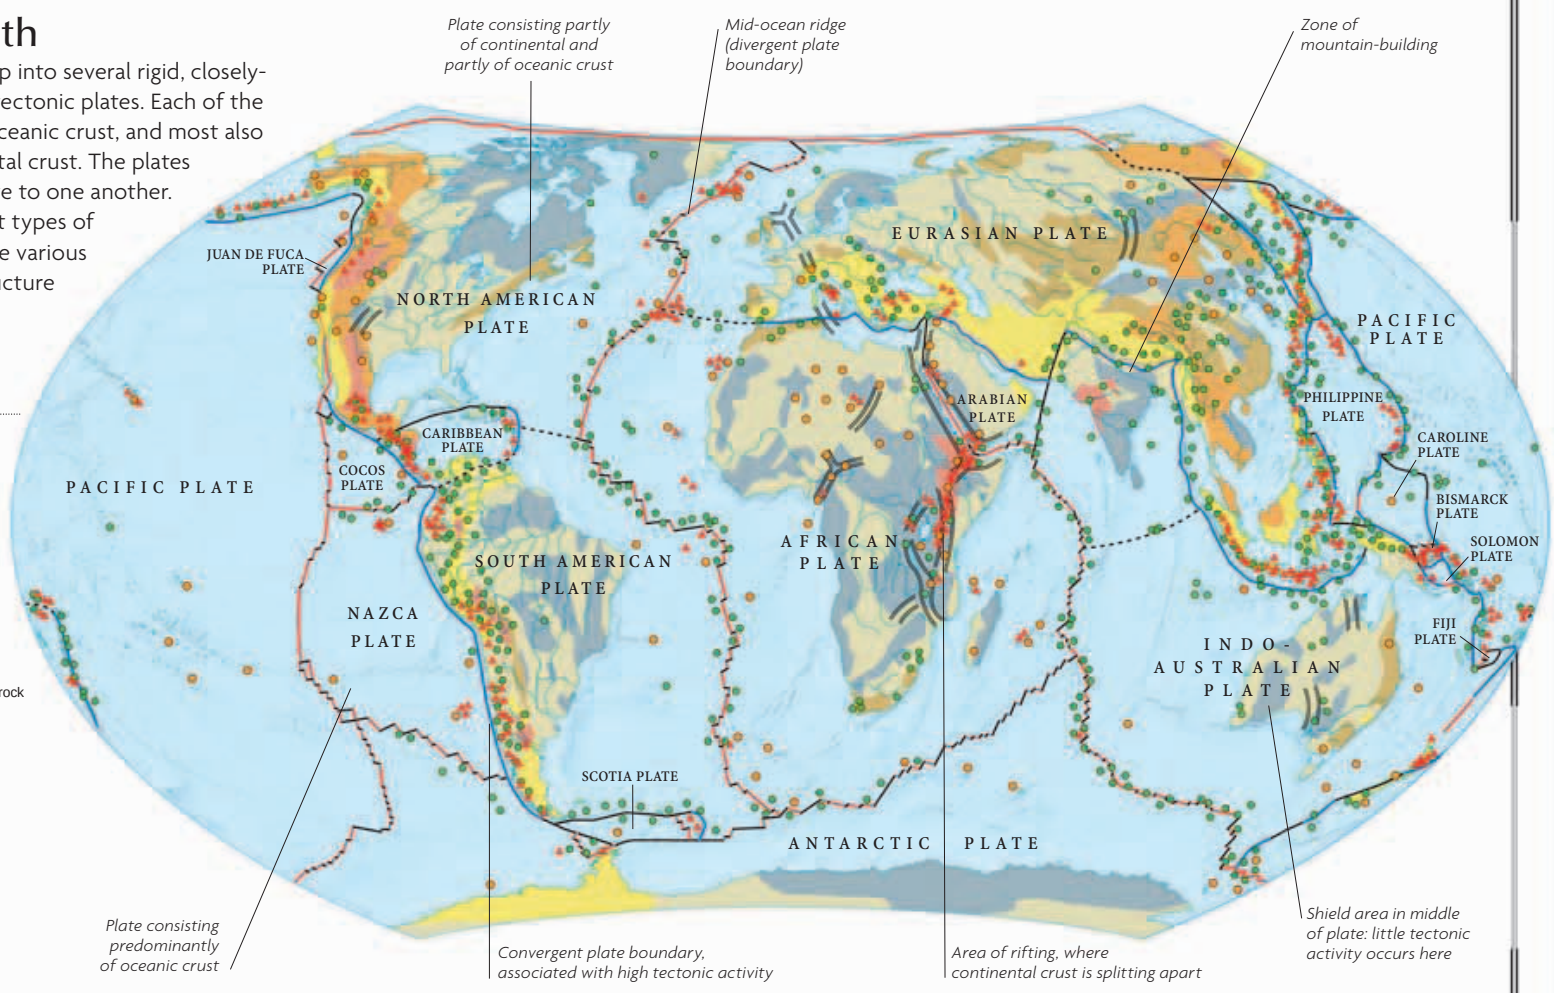
Cambrian 543–490 million years ago

Devonian 418–354 million years ago

Carboniferous 354–290 million years ago

Dynamic Earth

Earth's surface is split up into several rigid, closely-fitting sections, called tectonic plates. Each of the plates contains some oceanic crust, and most also contain some continental crust. The plates constantly move relative to one another. Movements at different types of plate boundary produce various types of geological structure and activity.



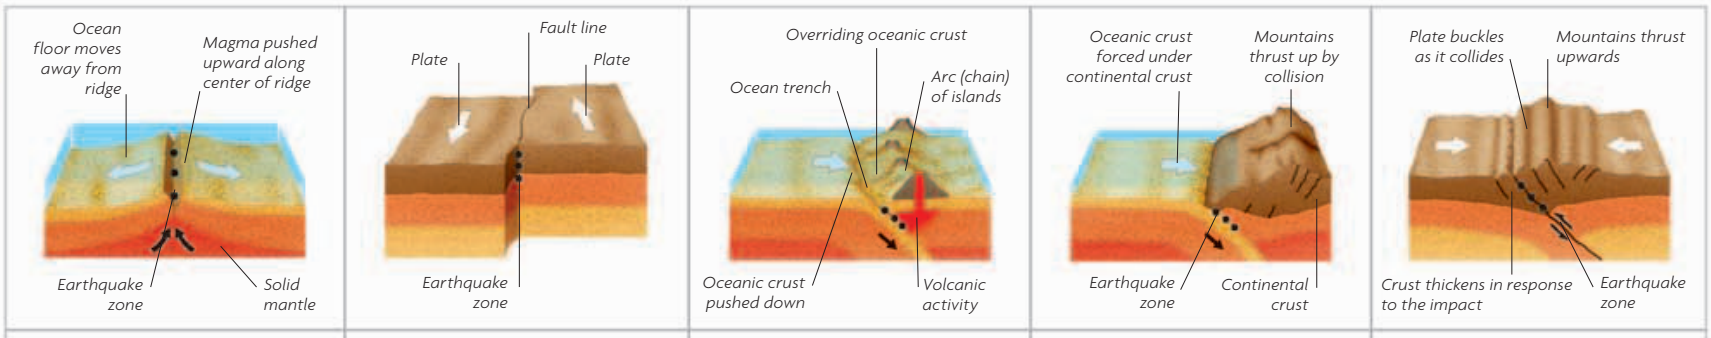
Tectonic activity and geological regions

Plate boundaries
- Convergent
- Divergent
- Transform
- Uncertain

Tectonic activity
- volcanic zone
- earthquake zone
- hot spot
- rift valley

- Sedimentary cover
- Mesozoic & Cenozoic volcanic rock
- Cenozoic (65 mya – present)
- Mesozoic (252 mya – 65 mya)
- Paleozoic (543 mya – 252 mya)
- pre-Cambrian Shields

EFFECTS AT PLATE BOUNDARIES



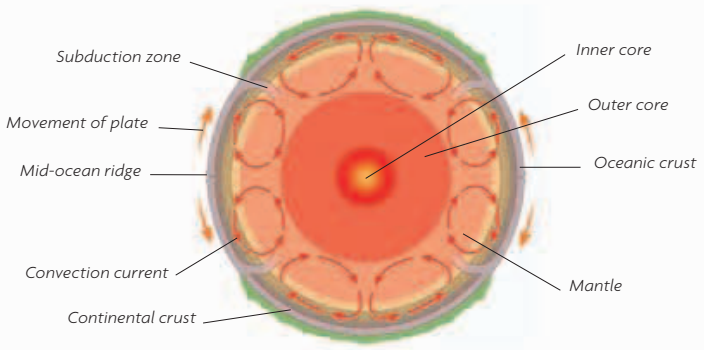
FORMATION OF A MID-OCEAN RIDGE	SLIDING PLATES (TRANSFORM BOUNDARY)	FORMATION OF ISLAND ARC AND OCEAN TRENCH	SUBDUCTION OF OCEANIC CRUST UNDER CONTINENTAL CRUST	BLOCKS OF CONTINENTAL CRUST COLLIDE TO FORM MOUNTAINS

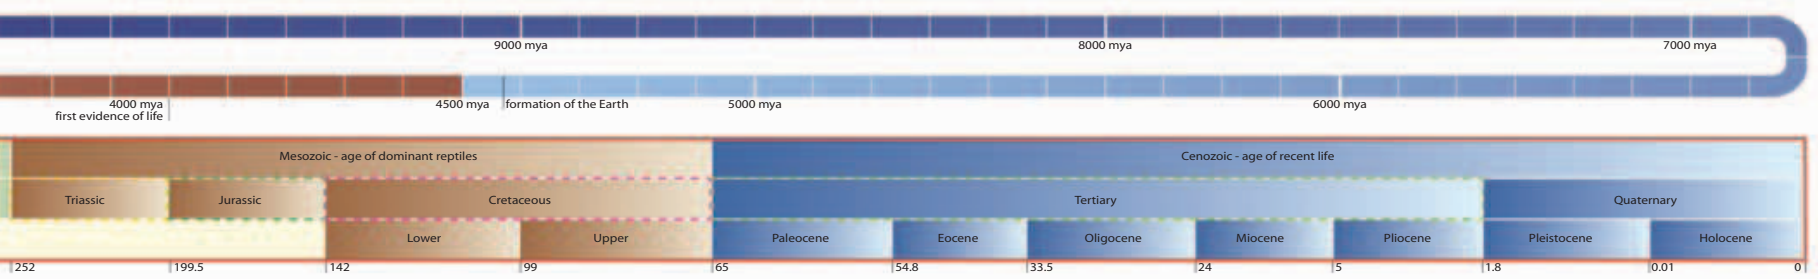
Boundary between upper mantle and crust

Sea floor made of oceanic crust

CONVECTION CURRENTS

Deep within Earth's core, temperatures may exceed 8100°F (4500°C). The heat from the core warms rocks in the mantle, which become semimolten and rise upwards, displacing cooler rock below the solid oceanic and continental crust. This rock sinks and is warmed again by heat given off from the core. The process continues in a cyclical fashion, producing convection currents below the crust. These currents lead, in turn, to gradual movements of the tectonic plates over the planet's surface.





Triassic 252–199.5 million years ago

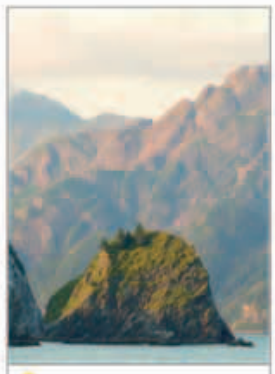
Jurassic 199.5–142 million years ago

Cretaceous 142–65 million years ago

Tertiary 65–2 million years ago

Shaping the Landscape

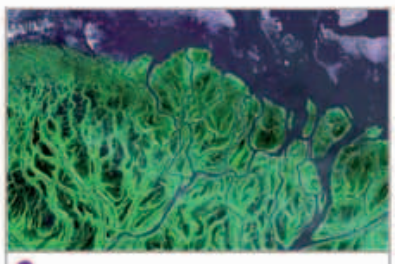
The basic material of Earth's surface is solid rock: valleys, deserts, soil, and sand are all evidence of the powerful agents of weathering, erosion and deposition that constantly transform Earth's landscapes. Water, whether flowing in rivers or grinding the ground in the form of glaciers, has the most clearly visible impact on Earth's surface. Also, wind can transport fragments of rock over huge distances and strip away protective layers of vegetation, exposing rock surfaces to the impact of extreme heat and cold. Many of the land-shaping effects of ice and water can be seen in northern regions such as Alaska *(below)*, while the effects of heat and wind are clearly visible in the Sahara *(far right)*.



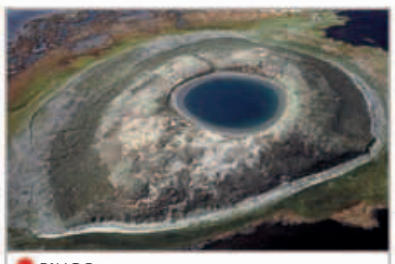
FJORD
A valley carved by an ancient glacier and later flooded by the sea is called a fiord.

Ice and water

Some of the most obvious and striking features of Earth's surface are large flows and bodies of liquid water, such as rivers, lakes, and seas. In addition to these are landforms caused by the erosional or depositional power of flowing water, which include gullies, river valleys, and coastal features such as headlands and deltas. Ice also has had a major impact on Earth's appearance. Glaciers—rivers of ice formed by the compaction of snow—pick up and carry huge amounts of rocks and boulders as they pass over the landscape, eroding it as they do so. Glacially-sculpted landforms range from mountain *cirques* and U-shaped valleys to fiords and glacial lakes.



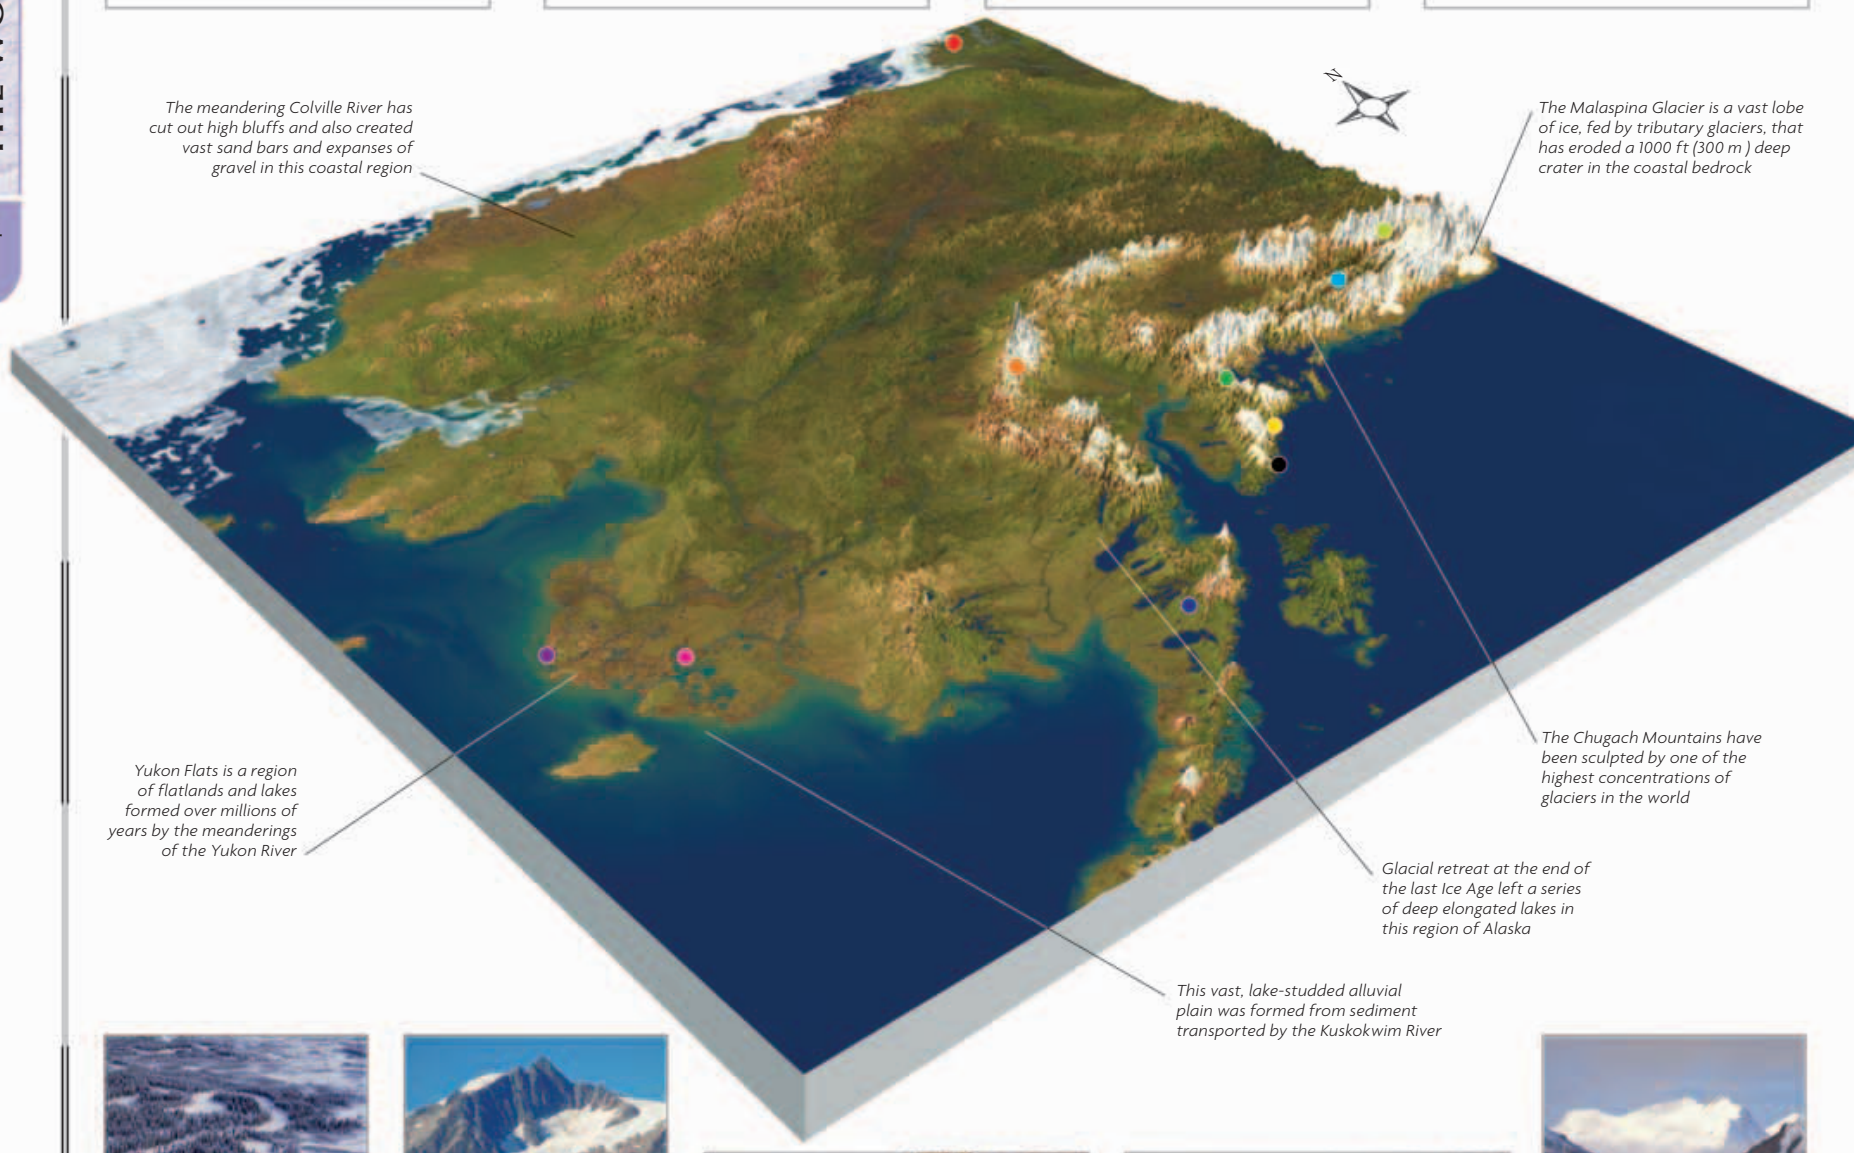
DELTA
A delta, such as that of the Yukon River (above), *is a roughly triangular or fan-shaped area of sediment deposited by a river at its mouth.*



PINGO
These blister-like mounds, seen in regions of Arctic tundra, are formed by the upward expansion of water as it freezes in the soil.

TIDEWATER GLACIER
Glaciers of this type flow to the sea, where they calve (disgorge) icebergs. Like all glaciers, they erode huge amounts of rock from the landscape.

LANDSLIDE
The freezing and later thawing of water, which occurs in a continuous cycle, can shatter and crumble rocks, eventually causing landslides.



MEANDERING RIVER
In their lower courses, some rivers carve out a series of looping bends called meanders.

CIRQUE
A cirque *is a hollow formed high on a mountain by glacial action. It may be ice-filled.*

POSTGLACIAL FEATURES
Glacially-polished cliffs like these are a tell-tale sign of ancient glacial action. Other signs include various forms of sculpted ridge and hummock.

RIVER VALLEY
Over thousands of years, rivers erode uplands to form characteristic V-shaped valleys, with flat narrow floors and steeply-rising sides.

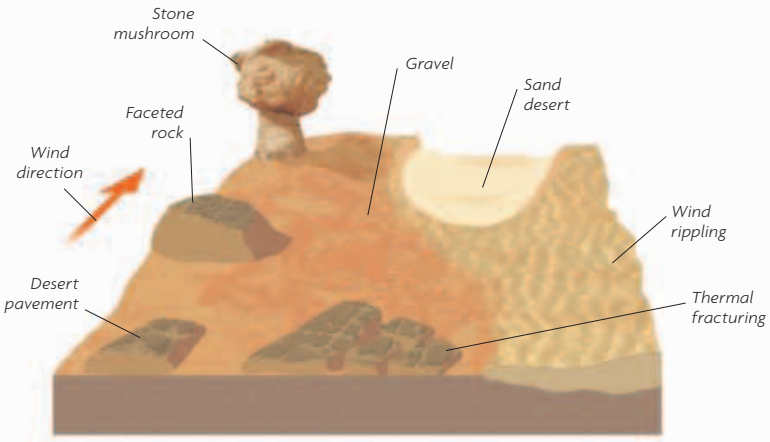
GULLIES
Gullies are deep channels cut by rapidly flowing water, as here below Alaska's Mount Denali.

Heat and wind

Marked changes in temperature—rapid heating caused by fierce solar radiation during the day, followed by a sharp drop in temperature at night—cause rocks at the surface of hot deserts to continually expand and contract. This can eventually result in cracking and fissuring of the rocks, creating thermally-fractured desert landscapes. The world's deserts are also swept and scoured by strong winds. The finer particles of sand are shaped into surface ripples, dunes, or sand mountains, which can rise to a height of 650 ft (200 m). In other areas, the winds sweep away all the sand, leaving flat, gravelly areas called desert pavements.

DESERT LANDSCAPES

In desert areas, wind picks up loose sand and blasts it at the surface, creating a range of sculpted landforms from faceted rocks to large-scale features such as *yardangs*. Individually sculpted-rocks are called ventifacts. Where the sand abrasion is concentrated near the ground, it can turn these rocks into eccentrically-shaped "stone mushrooms." Other desert features are produced by thermal cracking and by winds continually redistributing the vast sand deposits.



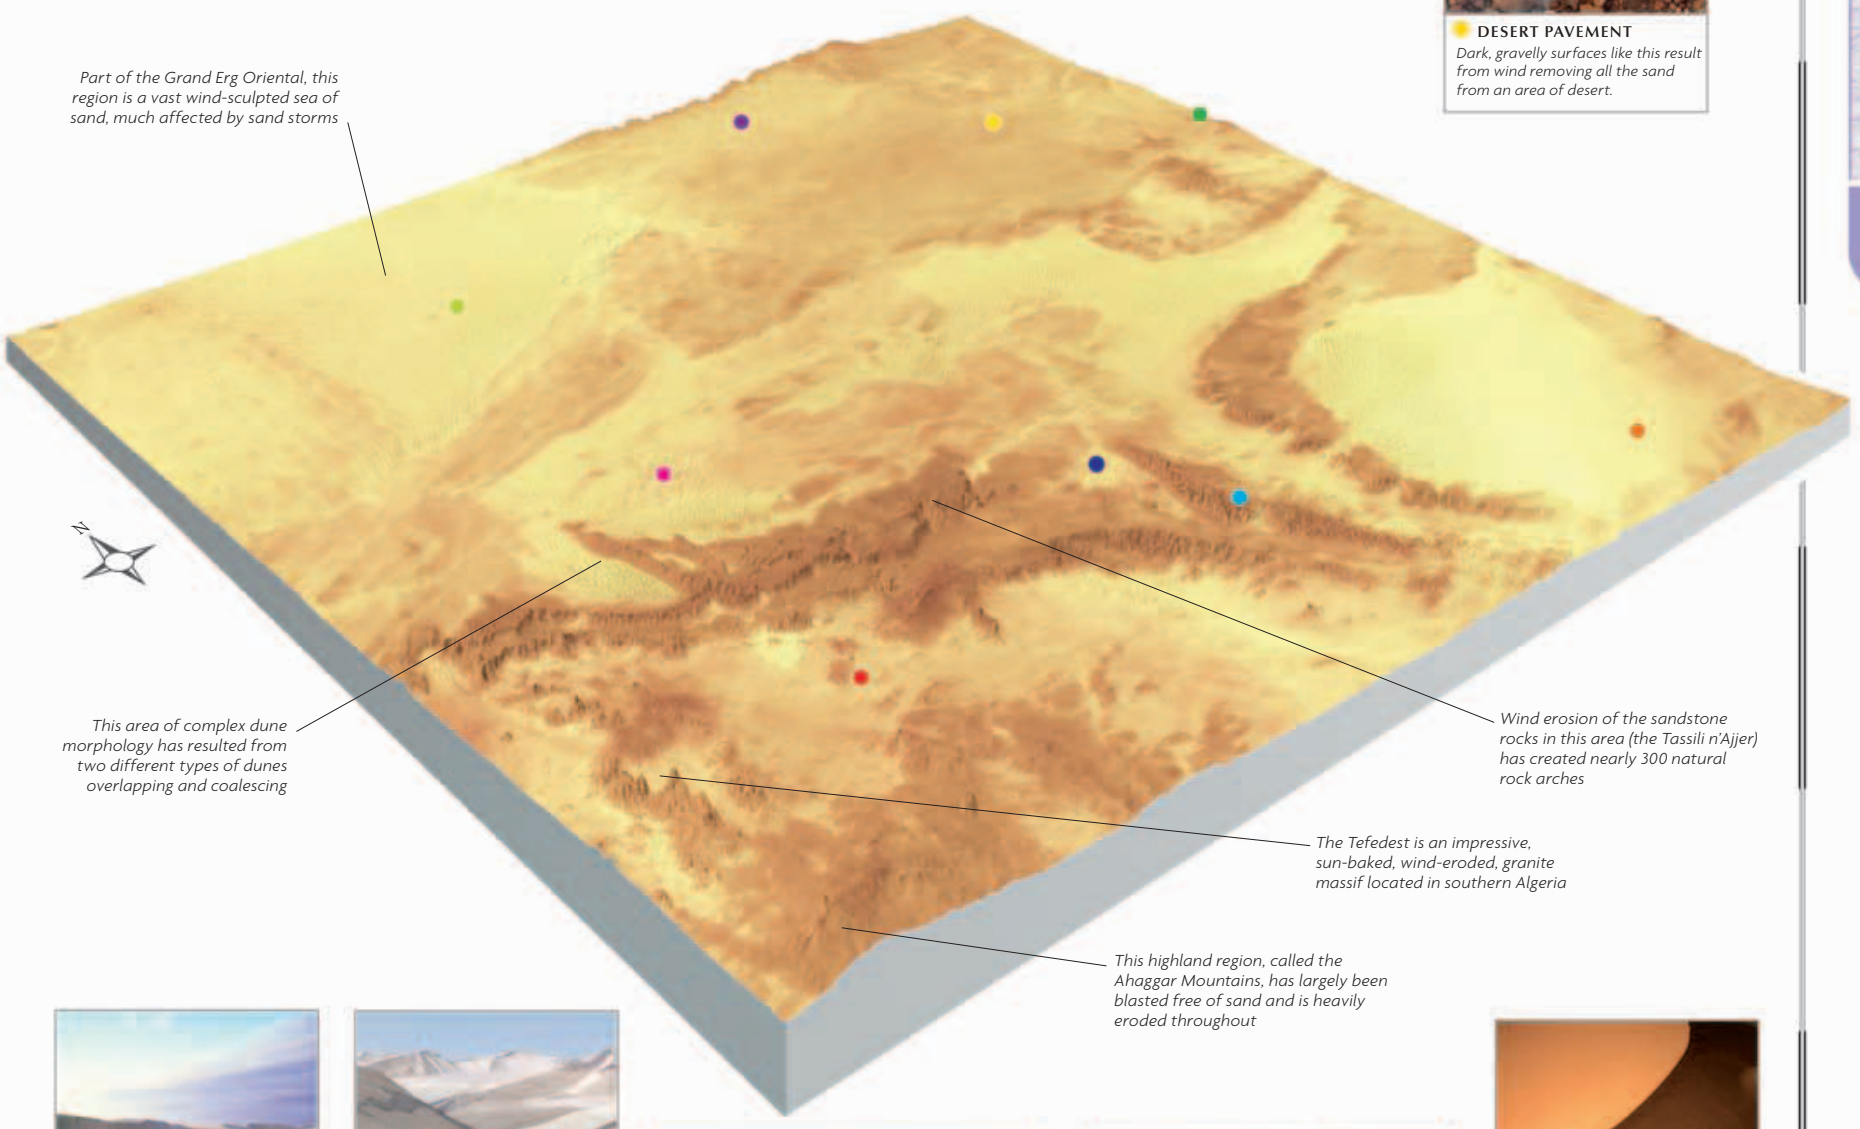
FEATURES OF A DESERT SURFACE

DUST STORM
A common phenomenon in some deserts, dust storms result from intense heating of the ground creating strong convection currents.

LOESS DEPOSIT
A deposit of silt that has been transported over long distances by wind, then compacted. Loess *is found in a few marginal areas of the Sahara.*

YARDANG
A yardang *is a ridge of rock produced by wind erosion, usually in a desert. Large* yardangs *can be many miles long.*

DESERT PAVEMENT
Dark, gravelly surfaces like this result from wind removing all the sand from an area of desert.



TRANSVERSE DUNES
This series of parallel sand ridges lies at right angles to the prevailing wind direction.

VENTIFACT
A ventifact is a rock that has been heavily sculpted and abraded by wind-driven sand.

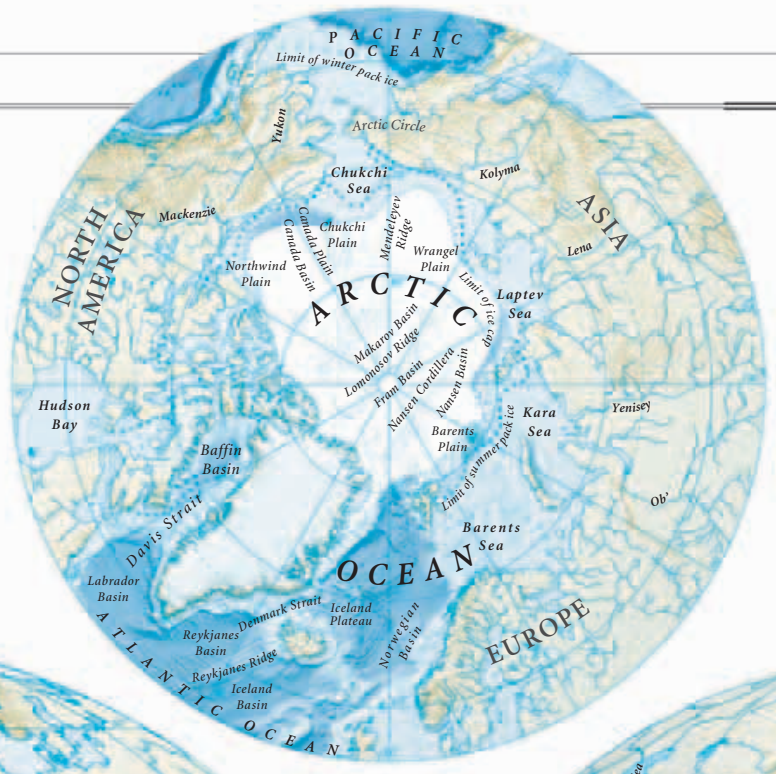
CRACKED DESERT
Intensely heated and dried-out desert areas often developed geometrically-patterned surface cracking.

WADI
Wadis are dried out stream beds, found in some desert regions, that carry water only during occasional periods of heavy rain.

BARCHAN DUNE
This arc-shaped type of dune migrates across the desert surface, blown by the wind.

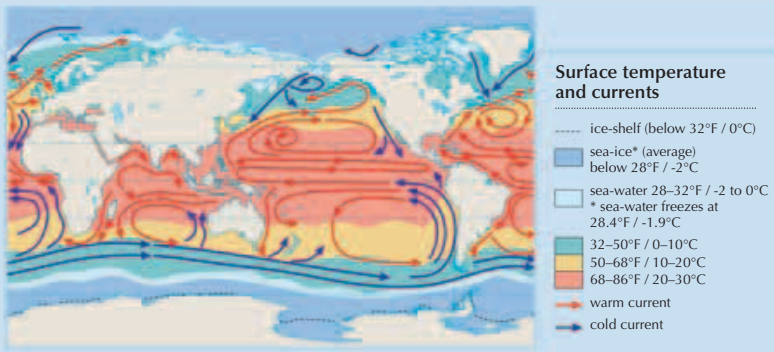
The World's Oceans

Two-thirds of Earth's surface is covered by the five oceans: the Pacific, Atlantic, Indian, Southern (or Antarctic), and Arctic. The basins that form these oceans, and the ocean floor landscape, have formed over the past 200 million years through volcanic activity and gradual movements of the Earth's crust. Surrounding the continents are shallow flat regions called continental shelves. These shelves extend to the continental slope, which drops steeply to the ocean floor. There, vast submarine plateaus, known as abyssal plains, are interrupted by massive ridges, chains of seamounts, and deep ocean trenches.

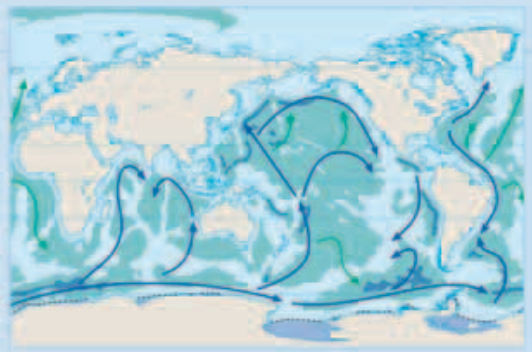


Ocean currents

Surface currents are driven by winds and by the Earth's rotation. Together these cause large circular flows of water over the surface of the oceans, called gyres. Deep sea currents are driven by changes in the salinity or temperature of surface water. These changes cause the water to become denser and sink, forcing horizontal movements of deeper water.



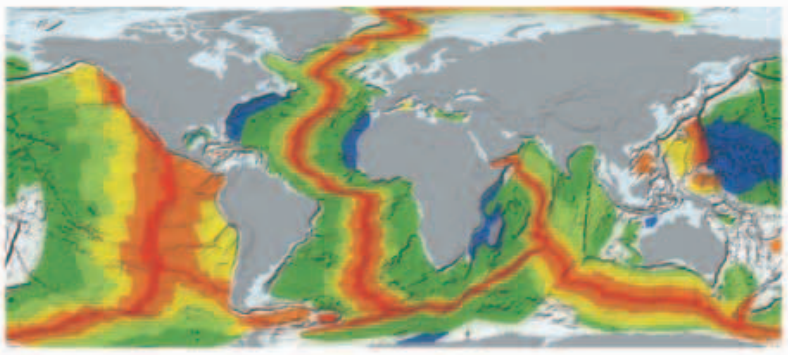
SURFACE TEMPERATURES AND CURRENTS



DEEP SEA TEMPERATURES AND CURRENTS

The ocean floor

The ages of seafloor rocks increase in parallel bands outward from central ocean ridges. At these ridges, new oceanic crust is continuously created from lava that erupts from below the seafloor and then cools to form solid rock. As this new crust forms, it gradually pushes older crust away from the ridge.

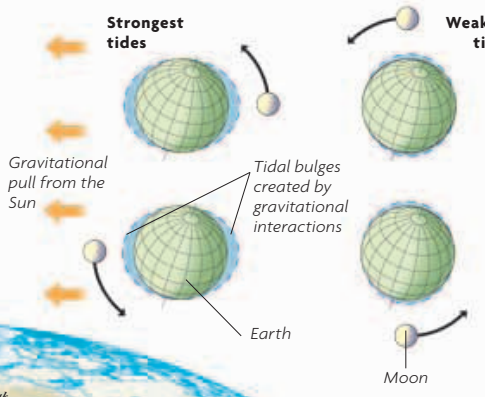


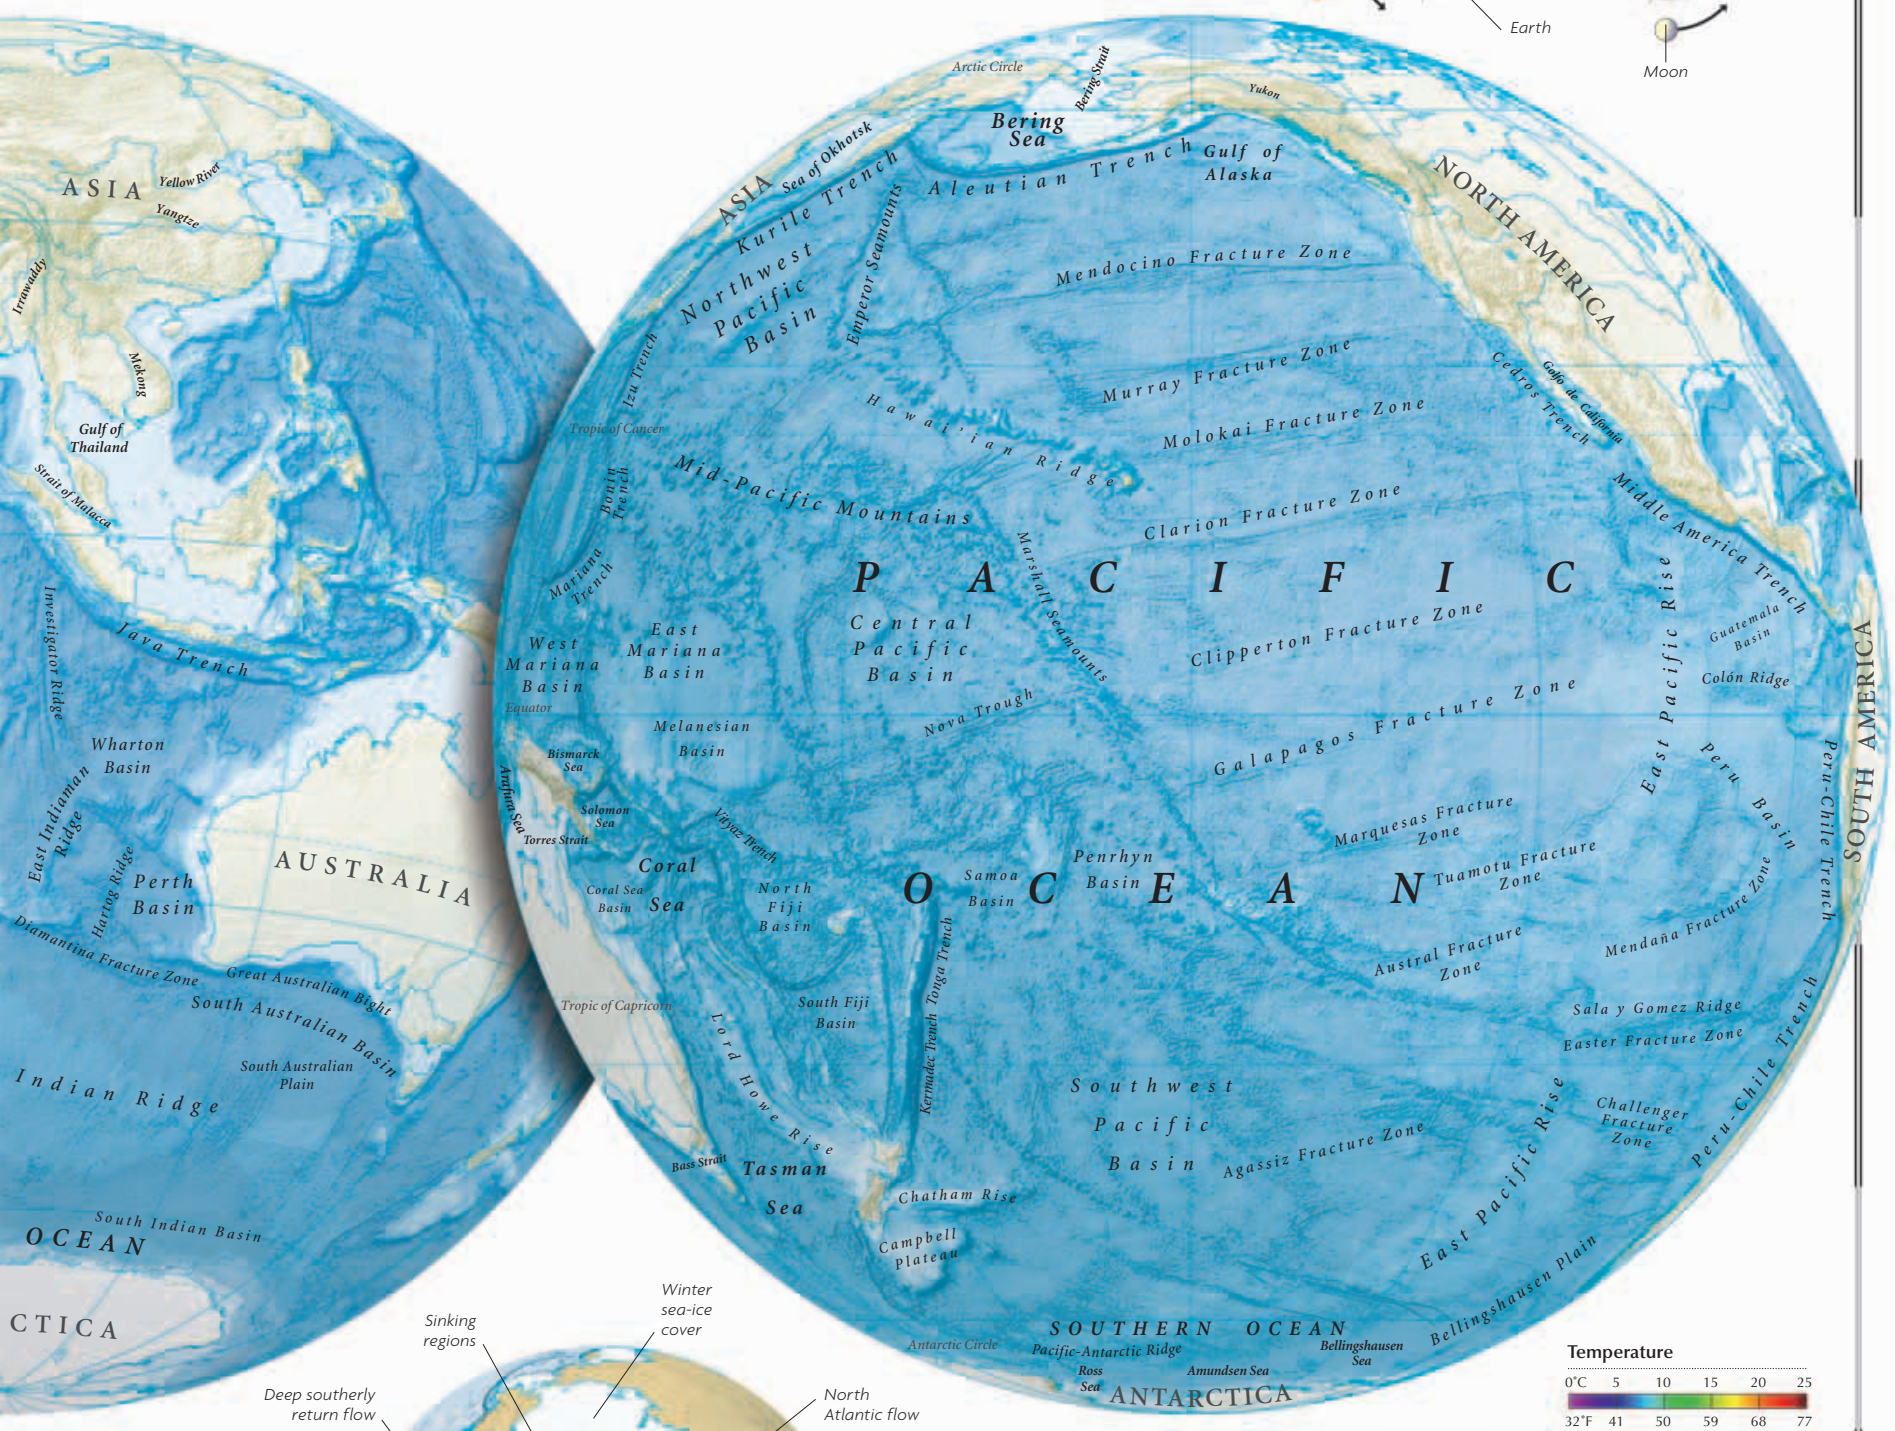
Ages of the ocean crust

- 0–5 million years
- 5–21 million years
- 21–38 million years
- 38–65 million years
- 65–140 million years
- 140–190 million years
- continental shelf
- no data

Tides

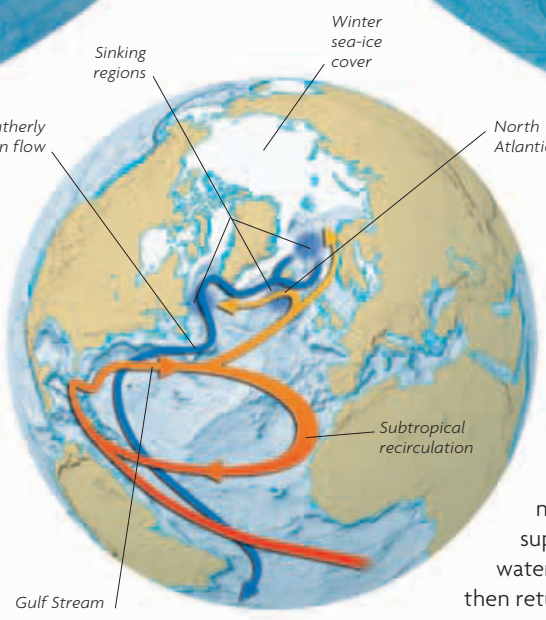
Tides are caused by gravitational interactions between the Earth, Moon, and Sun. The strongest tides occur when the three bodies are aligned and the weakest when the Sun and Moon align at right angles





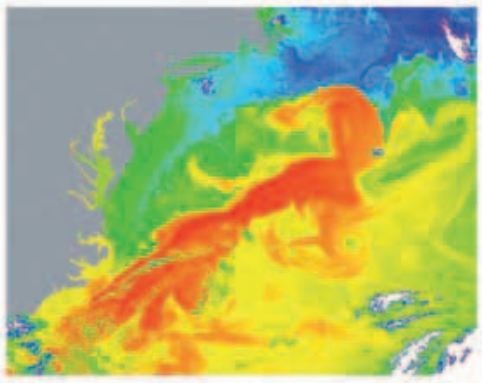
Deep sea temperature and currents

- ice-shelf (below 32°F / 0°C)
- sea-water 28–32°F / -2 to 0°C (below 16,400 ft / 5000 m)
- sea-water 32–41°F / 0–5°C (below 13,120 ft / 4000 m)
- primary currents
- secondary currents



North Atlantic Heat Conveyor

The North Atlantic Heat Conveyor is a system of heat flows in the Atlantic that keeps western Europe relatively warm. Surface currents, notably the Gulf Stream and its extension, the North Atlantic Drift, carry warm water from the tropical Atlantic into the northeastern Atlantic. There, the heat they supply is released, warming Europe, while the water itself cools and sinks. This cold water then returns at depth towards the equator.

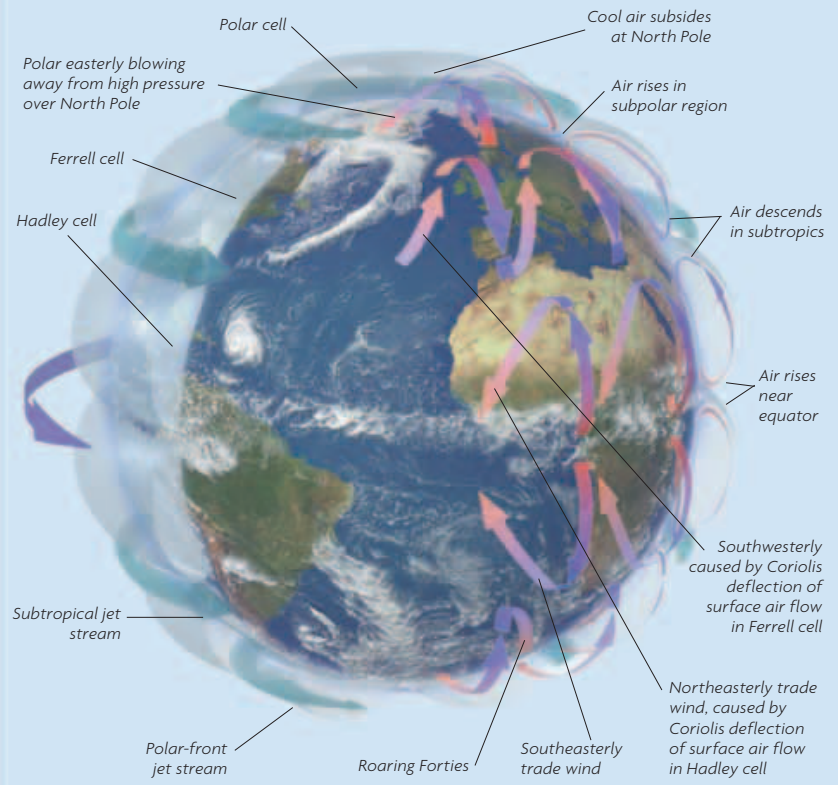


A key part of the North Atlantic Heat Conveyor is the warm Gulf Stream, visible as the dark red ribbon in this Atlantic sea-surface temperature map.

Global Climate

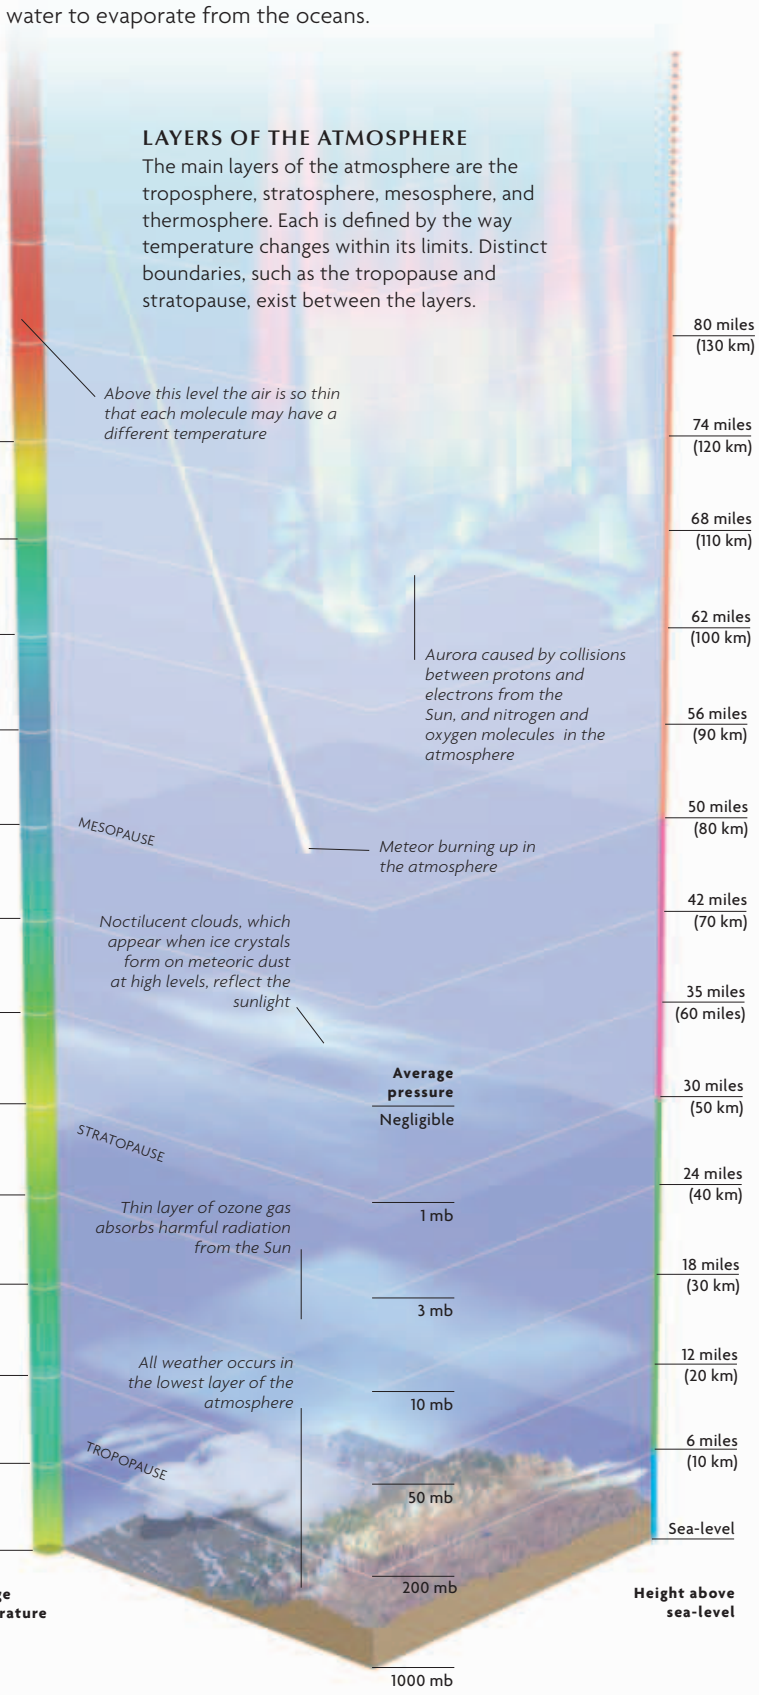
The climates of different regions on Earth are the typical long-term patterns of temperature and humidity in those regions. By contrast, weather consists of short-term variations in factors such as wind, rainfall, and sunshine. Climates are determined primarily by the Sun's variable heating of different parts of Earth's atmosphere and oceans, and by Earth's rotation. These factors drive the ocean currents and prevailing winds, which in turn redistribute heat energy and moisture between the equator and poles, and between sea and land. Most scientists think that major changes are currently occurring in global climate due to the effects of rising carbon dioxide levels in the atmosphere.

Global air circulation



The atmosphere

Earth's atmosphere is a giant ocean of air that surrounds the planet. It extends to a height of about 625 miles (1000 km) but has no distinct upper boundary. The Sun's rays pass through the atmosphere and warm Earth's surface, causing the air to move and water to evaporate from the oceans.



THERMOSPHERE

This layer extends from a height of 50 miles (80 km) upward. Its temperature increases rapidly above a height of 60 miles (90 km), due to absorption of highly energetic solar radiation.

MESOSPHERE

The temperature of the lower part of this layer stays constant with height; but above 35 miles (55 km), it drops, reaching -112°F (80°C) at the mesopause.

STRATOSPHERE

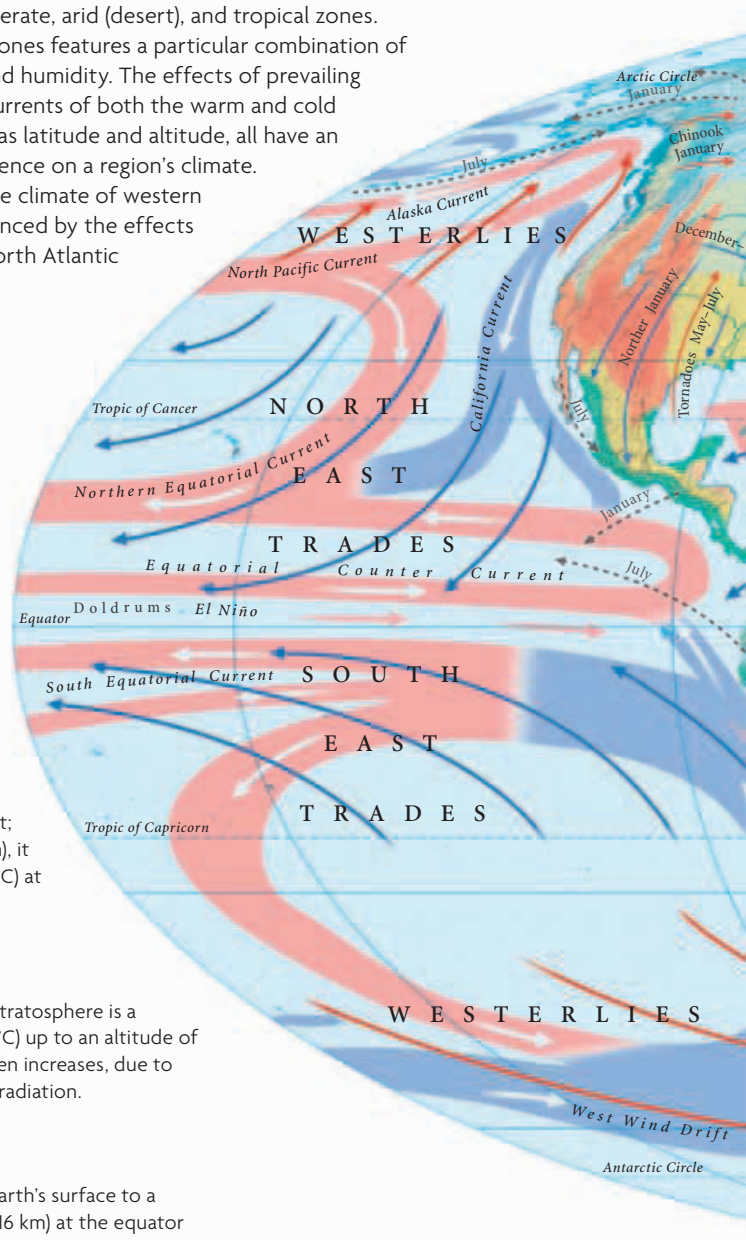
The temperature of the stratosphere is a fairly constant -76° F (-60°C) up to an altitude of about 12 miles (20 km), then increases, due to absorption of ultraviolet radiation.

TROPOSPHERE

This layer extends from Earth's surface to a height of about 10 miles (16 km) at the equator and 5 miles (8 km) at the poles. Air temperature in this layer decreases with height.

Winds, currents, and climate

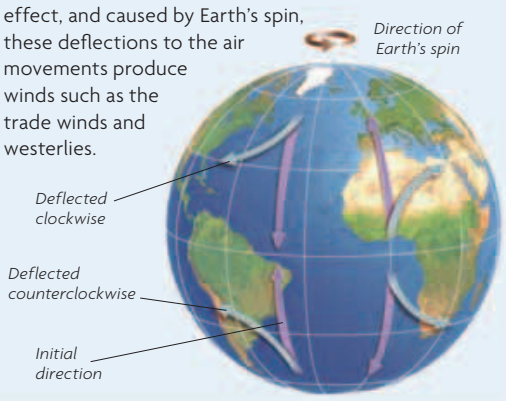
Earth has 12 climatic zones, ranging from ice-cap and tundra to temperate, arid (desert), and tropical zones. Each of these zones features a particular combination of temperature and humidity. The effects of prevailing winds, ocean currents of both the warm and cold variety, as well as latitude and altitude, all have an important influence on a region's climate. For example, the climate of western Europe is influenced by the effects of the warm North Atlantic Drift current.



Air moves within giant atmospheric cells called Hadley, Ferrell, and polar cells. These cells are caused by air being warmed and rising in some latitudes, such as near the equator, and sinking in other latitudes. This north-south circulation combined with the Coriolis effect *(below)* produces the prevailing surface winds.

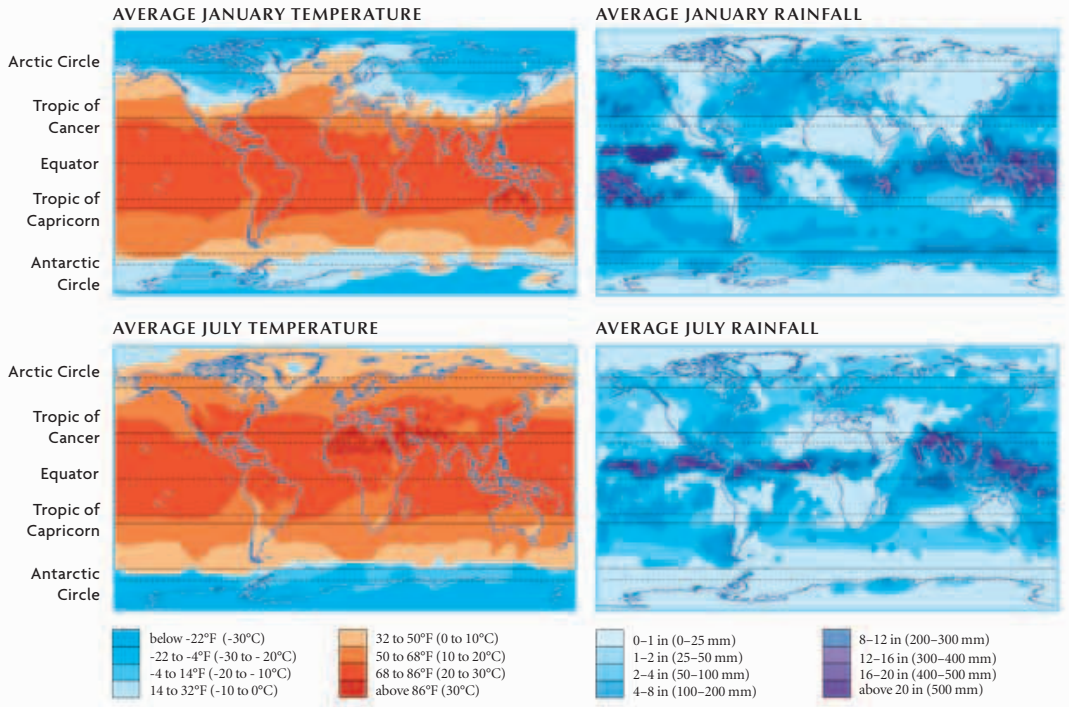
THE CORIOLIS EFFECT

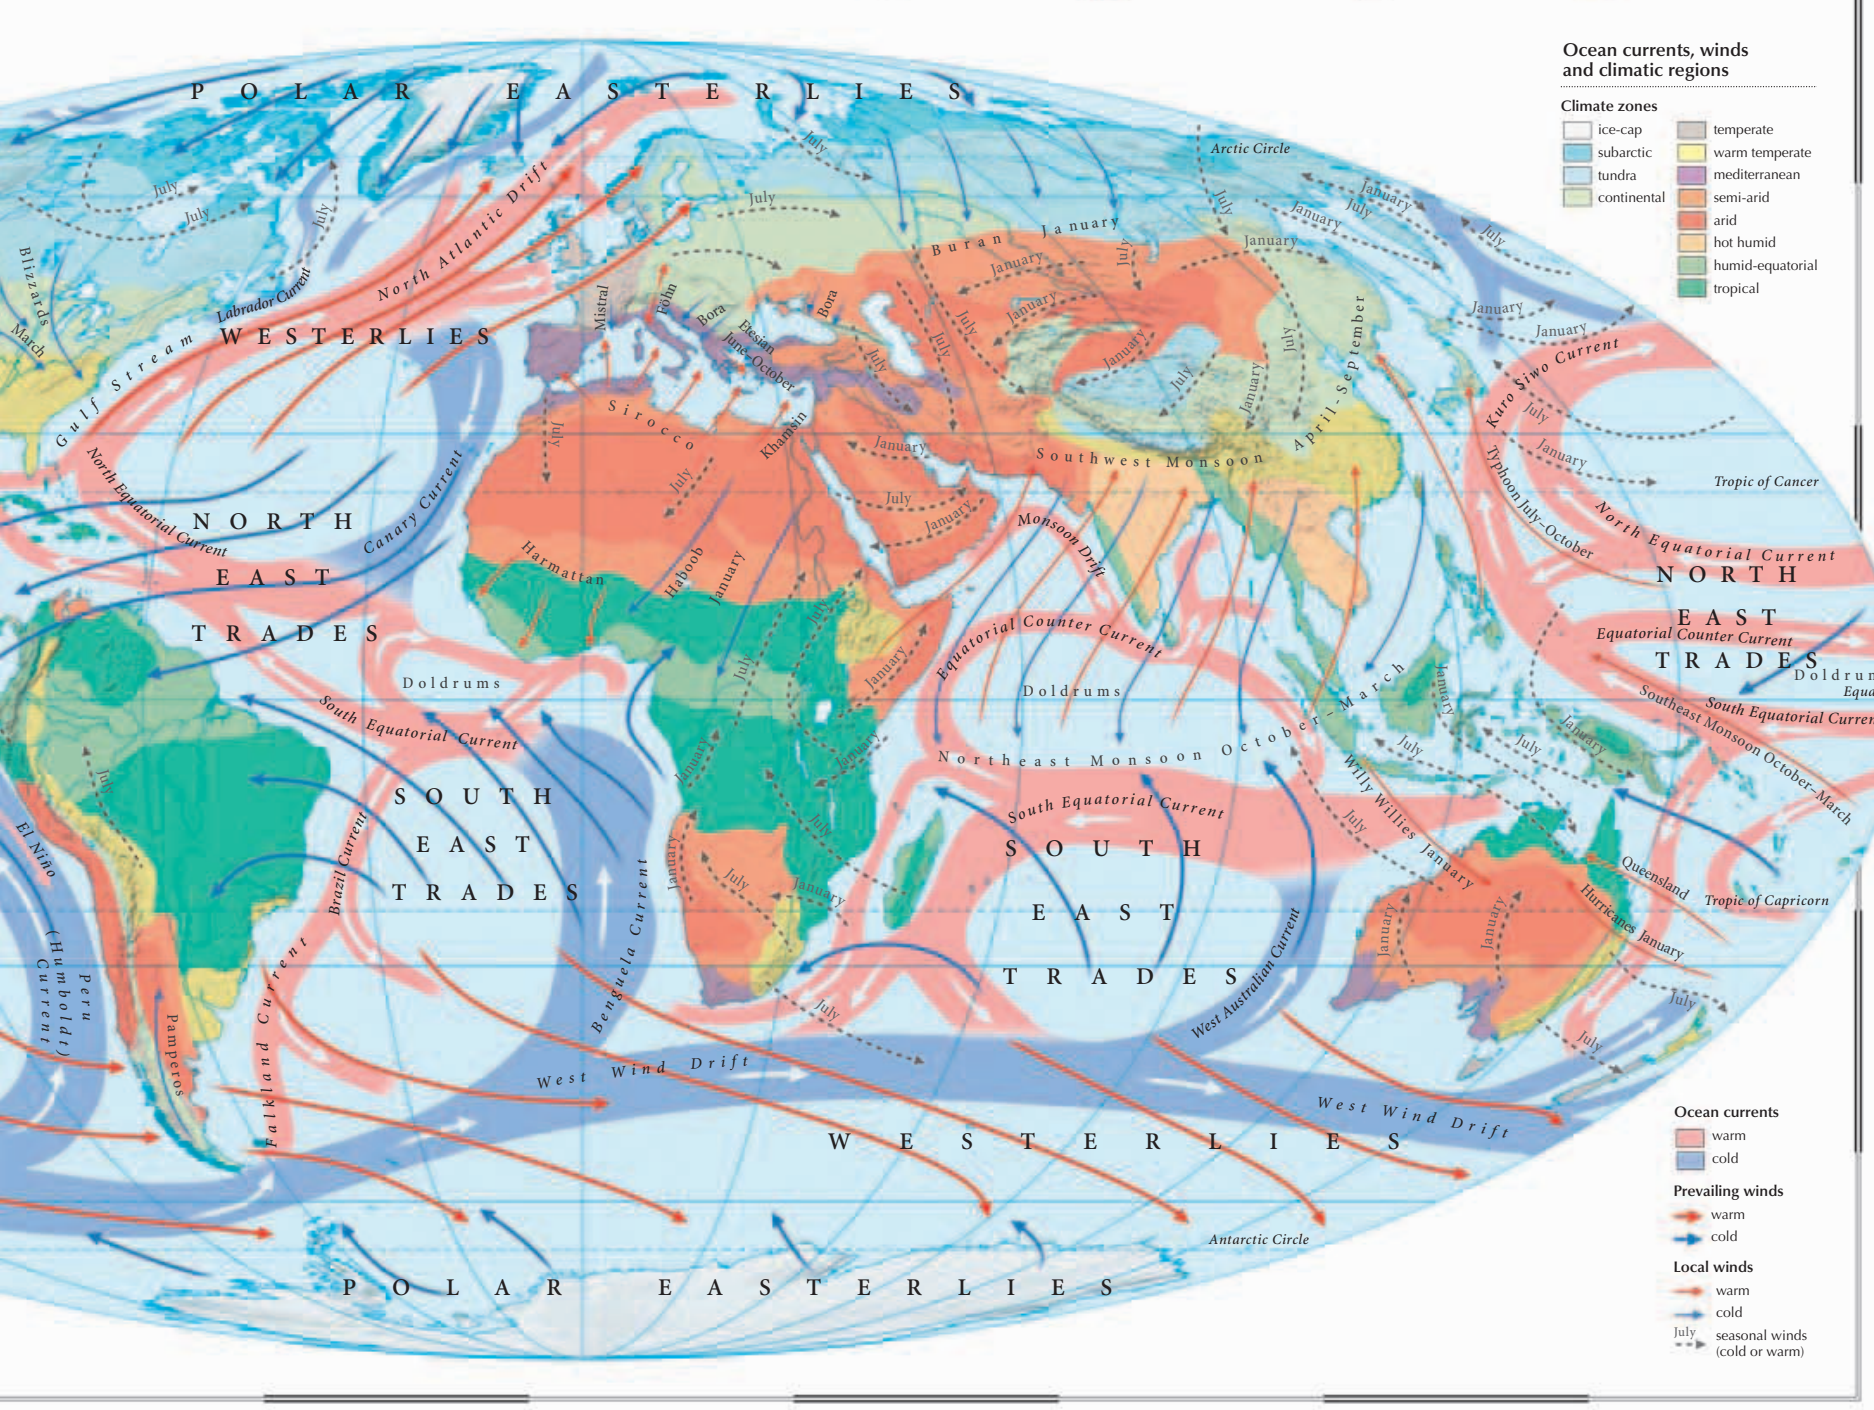
Air moving over Earth's surface is deflected in a clockwise direction in the northern hemisphere and counterclockwise in the south. Known as the Coriolis effect, and caused by Earth's spin, these deflections to the air movements produce winds such as the trade winds and westerlies.



Temperature and precipitation

The world divides by latitude into three major temperature zones: the warm tropics, the cold polar regions; and an intermediate temperate zone. In addition, temperature is strongly influenced by height above sea level. Precipitation patterns are related to factors such as solar heating, atmospheric pressure, winds, and topography. Most equatorial areas have high rainfall, caused by moist air being warmed and rising, then cooling to form rain clouds. In areas of the subtropics and near the poles, sinking air causes high pressure and low precipitation. In temperate regions rainfall is quite variable.





Life on Earth

A unique combination of an oxygen-rich atmosphere and plentiful surface water is the key to life on Earth, where few areas have not been colonized by animals, plants, or smaller life-forms. An important determinant of the quantity of life in a region is its level of primary production—the amount of energy-rich substances made by organisms living there, mainly through the process of photosynthesis. On land, plants are the main organisms responsible for primary production; in water, algae fulfil this role. These primary producers supply food for animals. Primary production is affected by climatic, seasonal, and other local factors. On land, cold and aridity restrict the quantity of life in a region, whereas warmth and regular rainfall allow a greater diversity of species. In the oceans, production is mainly affected by sunlight levels, which reduce rapidly with depth, and by nutrient availability.

POLAR REGIONS
Ice restricts life in these regions to just a few species, such as polar bears in the Arctic.

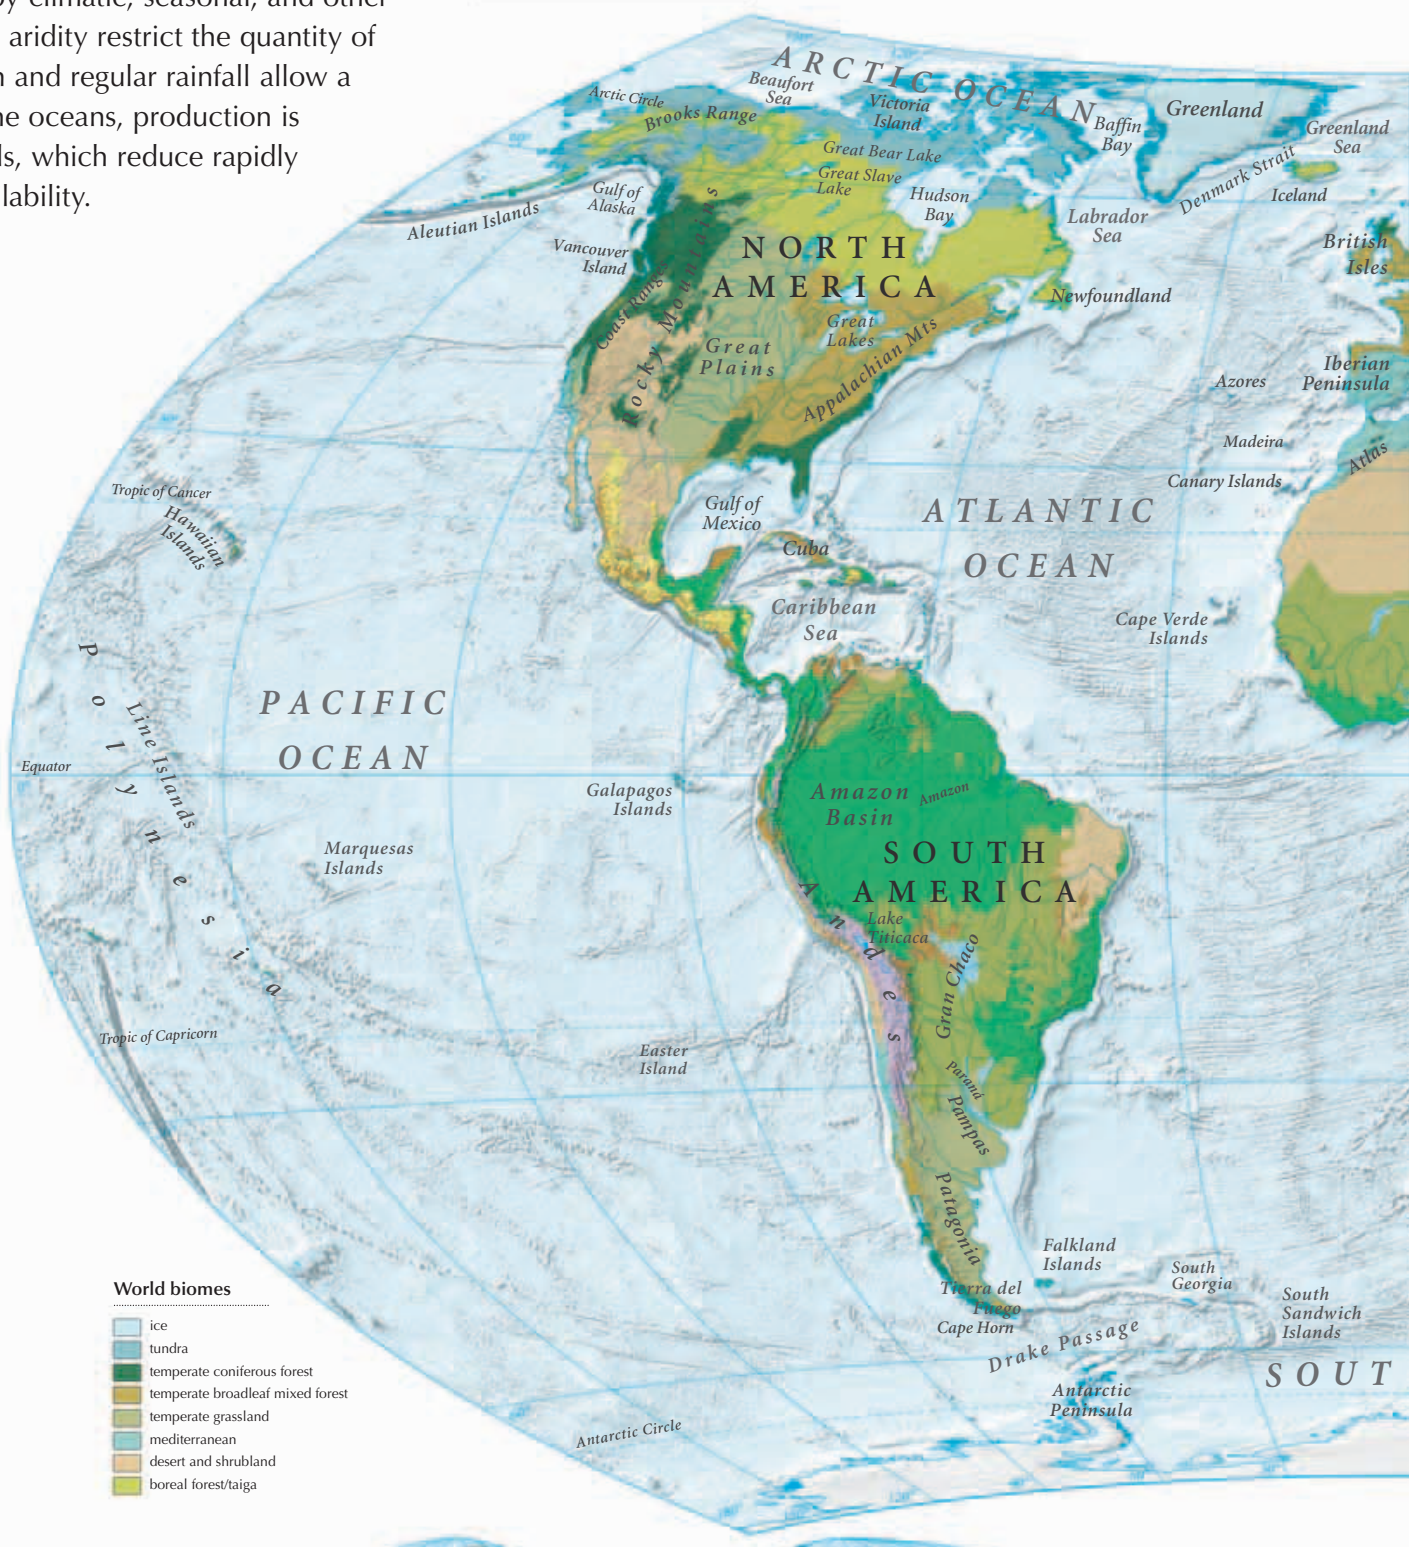
Biogeographical regions

Earth's biogeographical regions, or biomes, are communities where certain species of plants and animals coexist within the constraints of particular climatic conditions. They range from tundra to various types of grassland, forest, desert, and marine biomes such as coral reefs. Factors like soil richness, altitude, and human activities such as deforestation can affect the local distribution of living species in each biome.

TEMPERATE GRASSLAND
Also known as steppe or prairie, grassland of this type occurs mainly in the northern hemisphere and in South America (the Pampas).

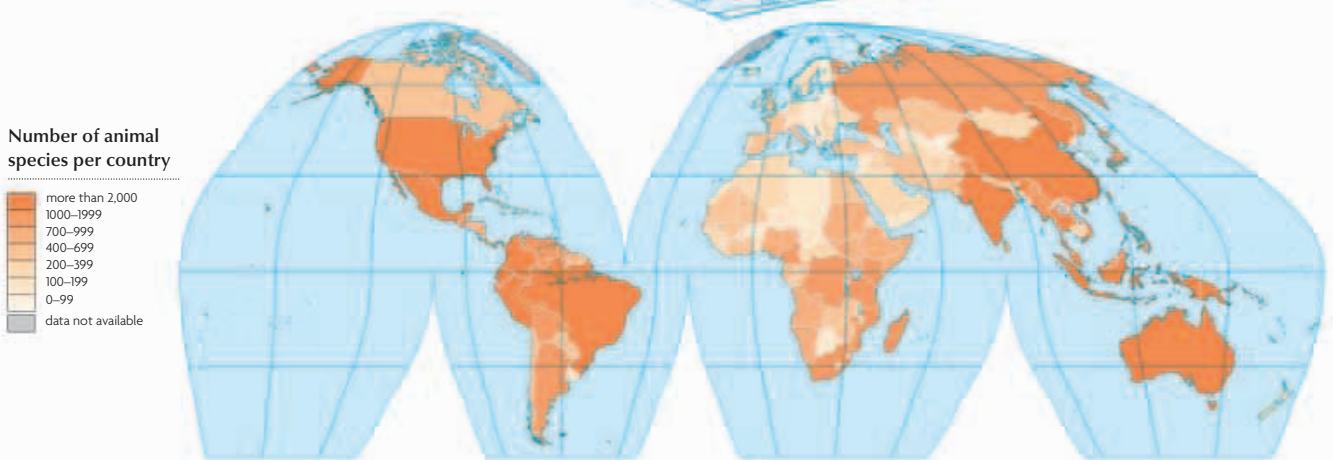
NEEDLELEAF FOREST
These vast forests of coniferous trees cover huge areas of Canada, Siberia, and Scandinavia.

TROPICAL GRASSLAND
This type of grassland is widespread in Africa and South America, supporting large numbers of grazing animals and their predators.



Animal diversity

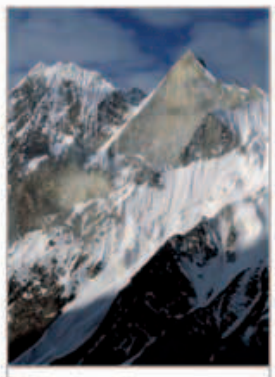
The number of animal species, and the range of genetic diversity within the populations of those species, determines the level of animal diversity within each country or other region of the world. The animals that are endemic to a region—that is, those found nowhere else on the planet—are also important in determining its level of animal diversity.



TUNDRA
With little soil and large areas of frozen ground, the tundra is largely treeless, though briefly clothed by small flowering plants in summer.

TEMPERATE RAIN FOREST
Occurring in mid-latitudes in areas of high rainfall, these forests may be predominantly coniferous or mixed with deciduous species.

CORAL REEFS
Occurring in clear tropical waters, coral reefs support an extraordinary diversity of species, especially fish and many types of invertebrate.



MOUNTAINS
In high mountain areas only a few hardy species of plant will grow above the tree-line.

TROPICAL RAINFOREST
Characterized by year-round warmth and high rainfall, tropical rainforests contain the highest diversity of plant and animal species on Earth.

HOT DESERT
Only a few highly adapted species can survive in hot deserts, which occur mainly in the tropics.

OPEN OCEAN
Earth's largest biome, the oceans are home to a vast diversity of fish, mammals, invertebrates, and algae.

- data not available

Plant diversity

Environmental conditions, particularly climate, soil type, and the extent of competition with other living organisms, influence the development of plants into distinctive forms and thus also the extent of plant diversity. Human settlement and intervention has considerably reduced the diversity of plant species in many areas.

Man and the Environment

The impact of human activity on the environment has widened from being a matter of local concern (typically over the build-up of urban waste, industrial pollution, and smog) to affect whole ecosystems and, in recent decades, the global climate. Problems crossing national boundaries first became a major issue over acid rain, toxic waste dumping at sea, and chemical spillages polluting major rivers. Current concerns center on loss of biodiversity and vital habitat including wetlands and coral reefs, the felling and clearance of great tropical and temperate forests, overexploitation of scarce resources, the uncontrolled growth of cities and, above all, climate change.

OZONE HOLE

Man-made chlorofluorocarbons (CFCs), used in refrigeration and aerosols, damaged the ozone layer in the stratosphere which helps filter out the sun's harmful ultraviolet rays. When a seasonal ozone hole first appeared in 1985 over Antarctica, a shocked world agreed to phase out CFC use.

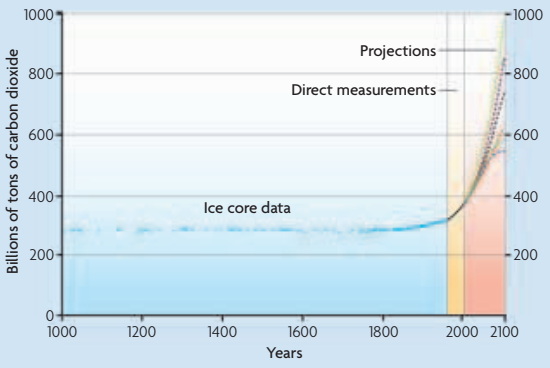
- countries without targets

Only the US has not ratified the Kyoto Protocol

Climate change

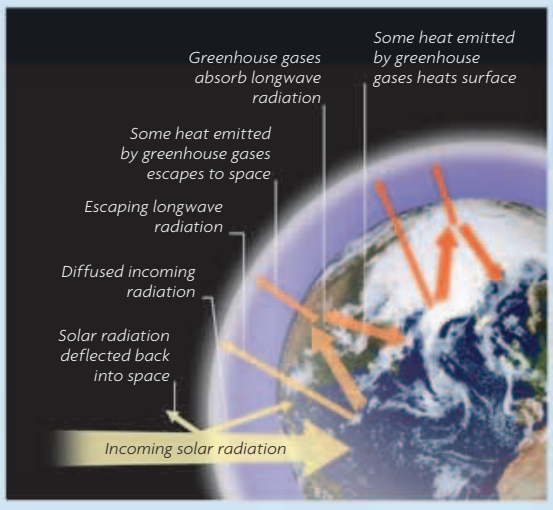
Global warming is happening much faster than Earth's normal long-term cycles of climate change. The consequences include unpredictable extreme weather and potential disruption of ocean currents. Melting ice-caps and glaciers, and warmer oceans, will raise average sea levels and threaten coastlines and cities. Food crops like wheat are highly vulnerable to changes in temperature and rainfall. Such changes can also have a dramatic affect on wildlife habitats.



Since 1800 the amount of $C0_2$ in the atmosphere has risen sharply. Urgent worldwide action to control emissions is vital to stabilize the level by the mid 21st century.

THE GREENHOUSE EFFECT

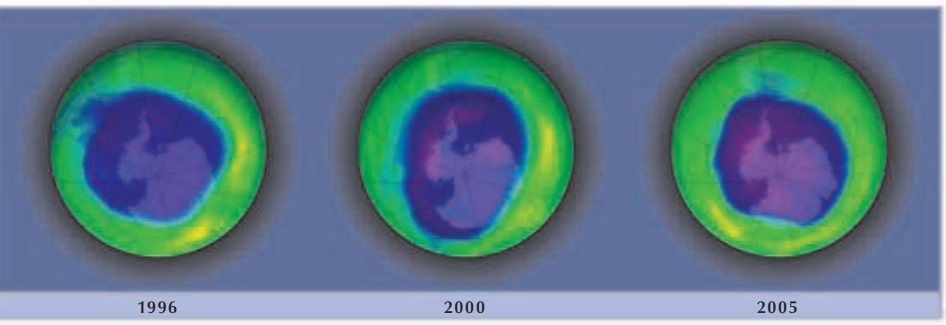
Some solar energy, reflected from the Earth's surface as infra red radiation, is reflected back as heat by "greenhouse gases" (mainly carbon dioxide and methane) in the atmosphere. Nearly all scientists now agree that an upsurge in emissions caused by humans burning fossil fuel has contributed to making the resultant warming effect a major problem.



FOOD AND LAND USE

The world has about five billion hectares of agriculturally useful land, well under one hectare per person. The majority of this is pasture for grazing. Crops are grown on about 30 percent (and nearly a fifth of cropland is artificially irrigated). Mechanized farming encouraged vast single crop "monocultures," dependent on fertilizers and pesticides. North America's endless prairies of wheat and corn, huge soybean plantations, and southern cotton fields are mirrored in Ukraine (wheat), Brazil and Argentina (soya) and Uzbekistan (cotton). Elsewhere, scarce farmland can be squeezed by the housing needs of growing urban populations. Current interest in crop-derived "biofuels" means further pressure to grow food more productively on less land.

Intensive farming. Satellite photography picks up the greenhouses that now cover almost all the land in this Spanish coastal area southwest of Almeria.



DEFORESTATION

At current rates of destruction, all tropical forests, and most old-growth temperate forest, will be gone by 2090. The Amazon rain forest is a valuable genetic resource, containing innumerable unique plants and animals, as well as acting as a crucial natural "sink" for absorbing climate-damaging carbon dioxide. Stemming the loss of these precious assets to logging and farming is one of the major environmental challenges of modern times.

Over 25,000 sq miles (60,000 sq km) of virgin rain forest are cleared annually by logging and agricultural activities, destroying an irreplaceable natural resource.

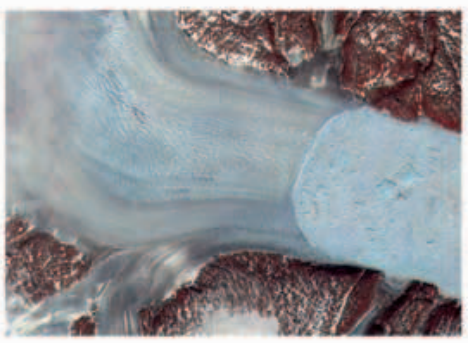
GLACIATION

The world's glaciers and ice sheets have been in retreat for decades, forming less new ice at high altitudes than they lose by melting lower down. The loss of ice from Greenland doubled between 1996 and 2005, with alarming implications for rising sea levels. Other dramatic evidence of global warming includes the rapid thinning of ice in the Himalayas, and the highly symbolic loss of the snowcap on Africa's Mount Kilimanjaro.

Helheim Glacier 2001
The Helheim glacier *(above)* almost completely fills this image, with the leading edge visible on the righthand side, and was in a relatively stable condition.

Helheim Glacier 2005
By 2005 *(right)* it had retreated by 2.5 miles (4 km).



Delhi 1971
In 1971 Delhi *(above)* occupied an area of about 190 sq miles (500 sq km).

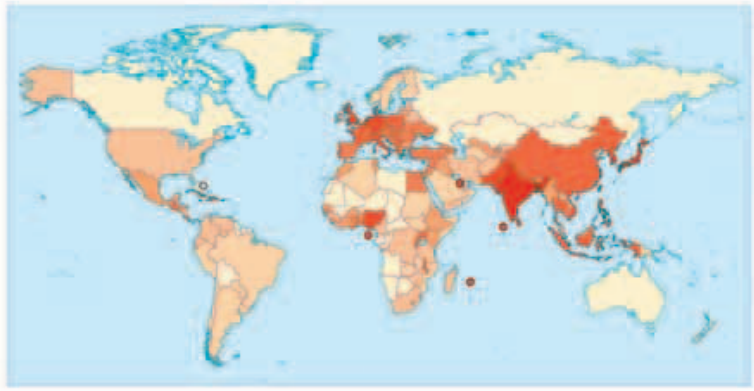
Delhi 1999
By 1999 *(right)* it had sprawled to cover 500 sq miles (1300 sq km). It vies with Mumbai in the southwest to be the sub-continent's most populous city, fast approaching 20 million people.

CITY GROWTH

The world in 2006 had five cities with populations over 20 million—Tokyo, Mexico City, Seoul, New York City, and São Paulo. The number of cities with populations between 10 and 20 million has reached 20 and continues to rise. The search for work, and the hope of escape from rural poverty, drives migration from rural to urban areas across the developing world. Urban dwellers now amount to more than half the world's population, and consume more resources than their rural counterparts.

Population and Settlement

Earth's human population is projected to rise from its current level of 6.9 billion to between 7.6 and 11 billion by the year 2050. The distribution of this population is very uneven and is dictated by climate, terrain, and by natural and economic resources. Most people live in coastal zones and along the valleys of great rivers such as the Ganges, Indus, Nile, and Yangtze. Deserts cover over 20 percent of Earth's surface but support less than 5 percent of its human population. Over half the world's population live in cities—most of them in Asia, Europe, and North America—as a result of mass migrations that have occurred from rural areas as people search for jobs. Many of these people live in so-called "megacities"—sprawling urban areas that have populations higher than 10 million.

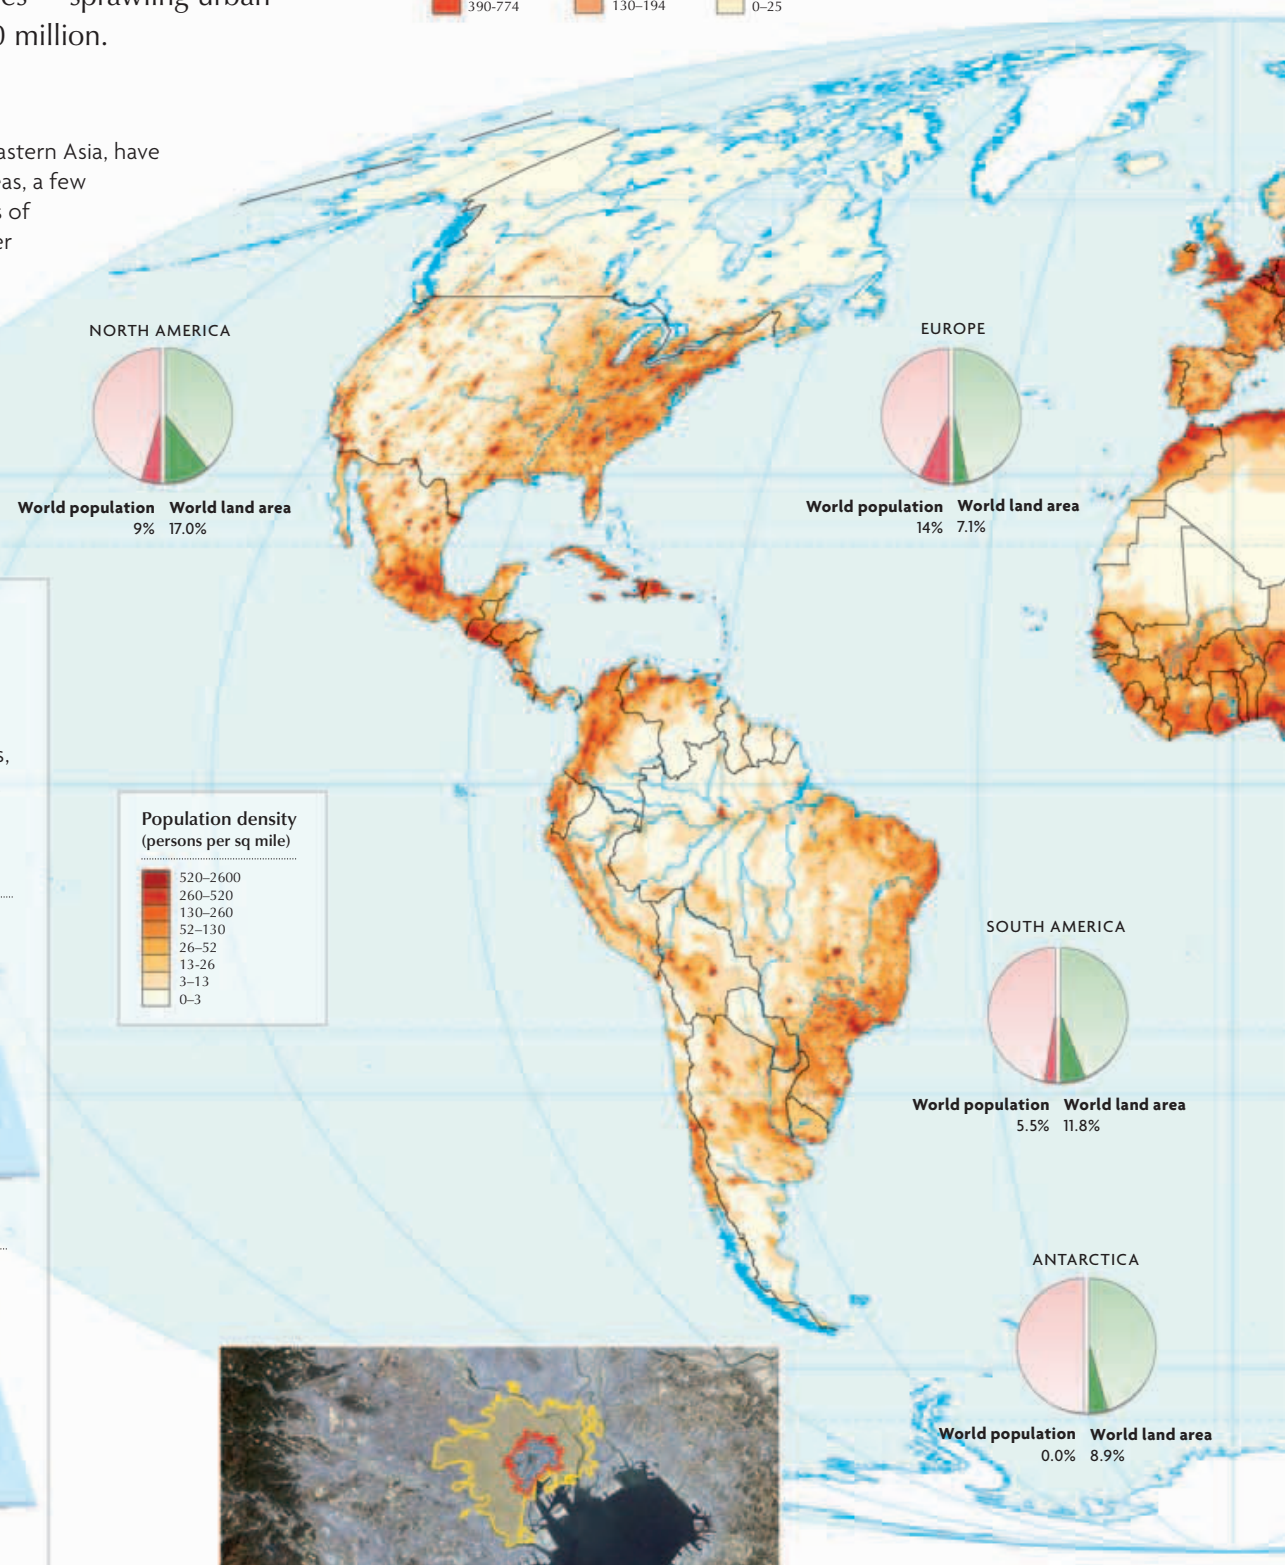


Population density by country (population per sq mile)

over 2600
775-2599
390-774
260-389
195–259
130–194
65–129
26–64
0–25

Population density

A few regions, including Europe, India, and much of eastern Asia, have extremely high population densities. Within these areas, a few spots, such as Monaco and Hong Kong, have densities of over 12,900 per sq mile (5000 people per sq km). Other regions (mostly desert, mountain, ice cap, tundra, or thickly forested areas) have densities close to zero –examples include large areas of Australia, western China, Siberia, North Africa, Canada, Greenland, and much of the Amazon rain forest region.



Million-person cities

In the year 1900 there were fewer than 20 cities in the world with a population that exceeded one million. By 1950 there were 75 such cities, and by the year 2000 there were more than 300 such cities, 40 of them in China alone, with another 30 in India, 14 in Brazil, and 10 in Japan.

Million-cities in 1900

Cities over 1 million in population

Million-cities in 1950

Tokyo urban sprawl

City boundary, 1860
City boundary, 1964

GREATER TOKYO

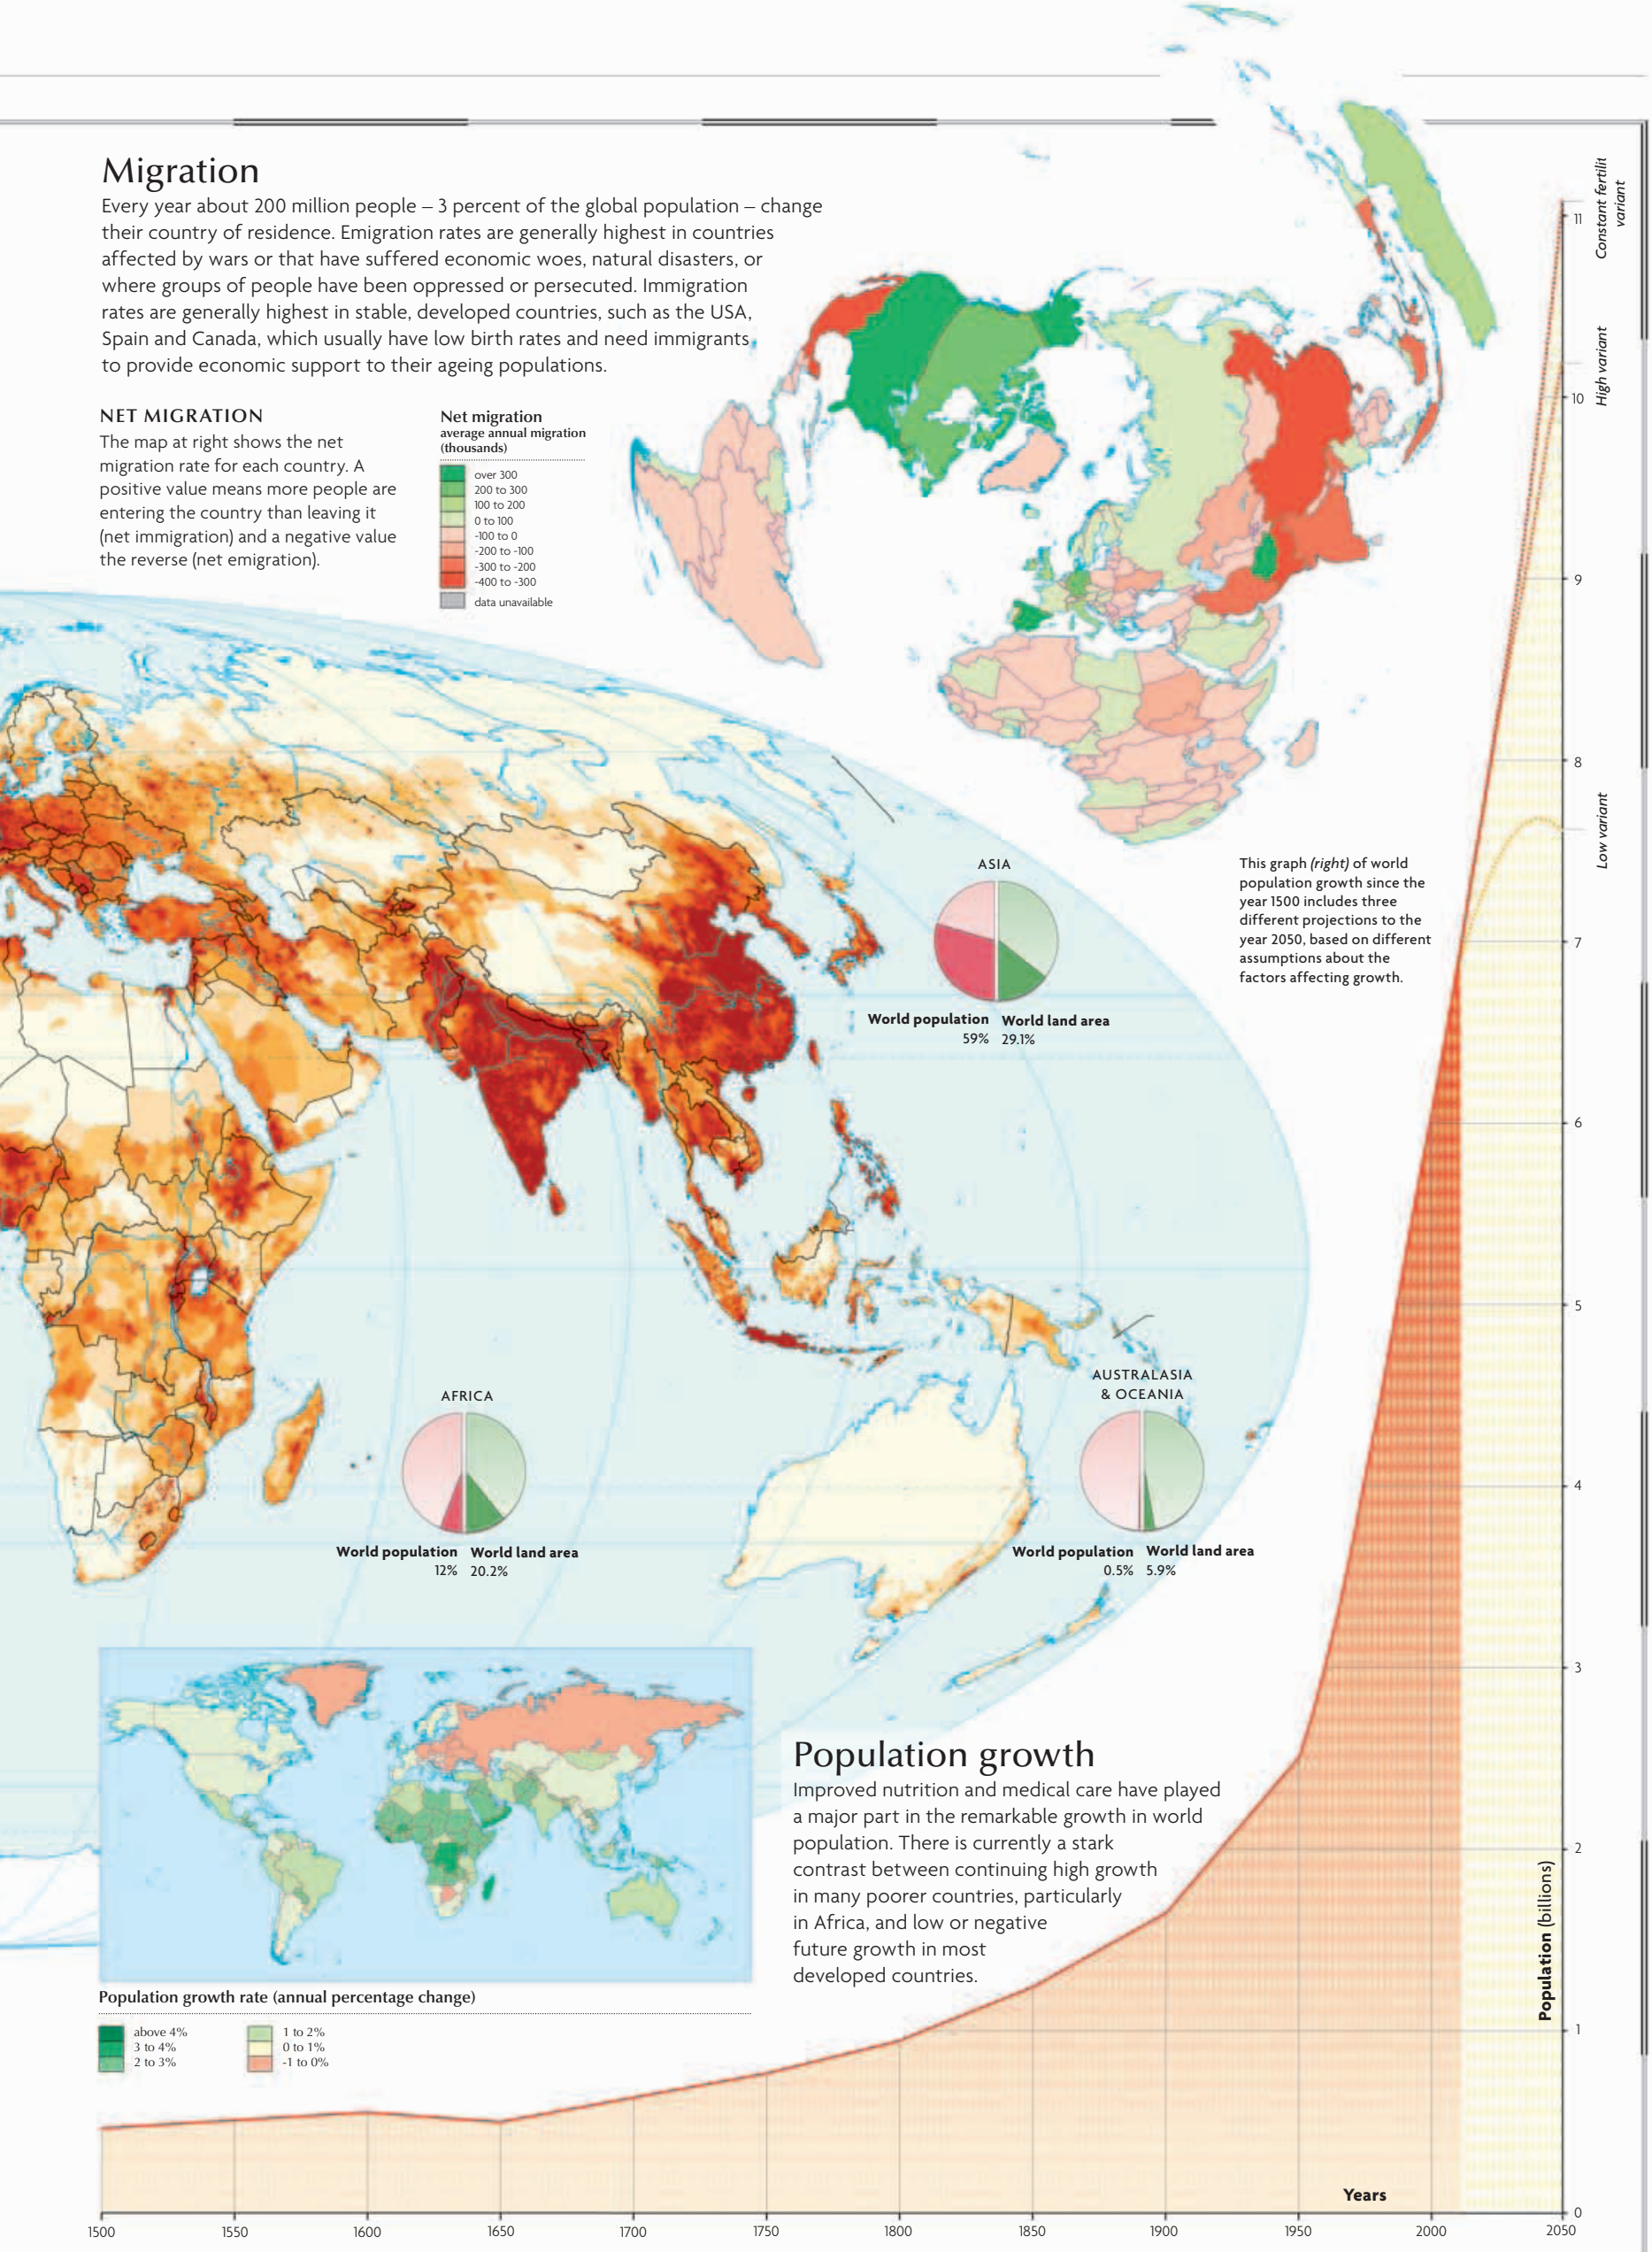
The Greater Tokyo Area is the most populous urban area in the world, with an estimated head count in 2011 of 35.6 million. It includes Tokyo City, which has a population of about 12 million, and adjoining cities such as Yokohama. This satellite photograph shows the Greater Tokyo Area today, and also the boundaries of Tokyo City in 1860 (red) and 1964 (yellow).

Migration

Every year about 200 million people – 3 percent of the global population – change their country of residence. Emigration rates are generally highest in countries affected by wars or that have suffered economic woes, natural disasters, or where groups of people have been oppressed or persecuted. Immigration rates are generally highest in stable, developed countries, such as the USA, Spain and Canada, which usually have low birth rates and need immigrants to provide economic support to their ageing populations.

NET MIGRATION

The map at right shows the net migration rate for each country. A positive value means more people are entering the country than leaving it (net immigration) and a negative value the reverse (net emigration).



This graph *(right)* of world population growth since the year 1500 includes three different projections to the year 2050, based on different assumptions about the factors affecting growth.

Population growth

Improved nutrition and medical care have played a major part in the remarkable growth in world population. There is currently a stark contrast between continuing high growth in many poorer countries, particularly in Africa, and low or negative future growth in most developed countries.

Language

Over 6800 different languages exist throughout the world, each one with its own unique evolutionary history and cultural connotations. Most of these languages are spoken only by small groups of people in remote regions. Sadly these minority tongues are dying out—it is estimated that about a third will have disappeared by the year 2100. The relatively small number of widely-spoken languages have gained their current predominance and pattern of distribution through a variety of historical factors. Among these have been the economic, military, or technological success of certain peoples and cultures, differing population growth rates, and the effects of migrations and colonization.

The European Union (EU) embraces the diversity of its 27 countries and 23 official languages by providing a translation and interpretation service for the majority of its meetings and documentation. This costs around US$ 650 million per year, which equates to 1 percent of the EU budget.

The colonial powers

Colonialism between the 15th and 20th centuries had a major influence in establishing the world prevalence of various, mainly European, languages. Britain, for example, was the colonial power in Canada, the USA (until 1776), the Indian subcontinent, Australia, and parts of Africa and the Caribbean. Hence, English is still the main (or a major) language in these areas. The same applies to France and the French language in parts of Africa and southeast Asia, and to Spain and the Spanish language in much of Latin America. For similar reasons, Portuguese is the main language in Brazil and parts of Africa, and there are many Dutch speakers in Indonesia.

This dual language sign, written in both in Hindi and English, stands outside Shimla railway station in northern India. The sign reflects India's past—the British used Shimla as their summer capital during the colonial period.

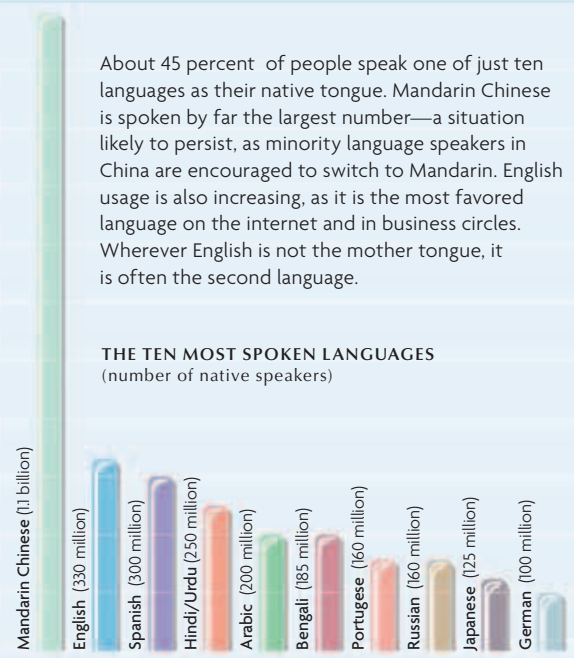
TOP TEN LANGUAGES

About 45 percent of people speak one of just ten languages as their native tongue. Mandarin Chinese is spoken by far the largest number—a situation likely to persist, as minority language speakers in China are encouraged to switch to Mandarin. English usage is also increasing, as it is the most favored language on the internet and in business circles. Wherever English is not the mother tongue, it is often the second language.

THE TEN MOST SPOKEN LANGUAGES
(number of native speakers)



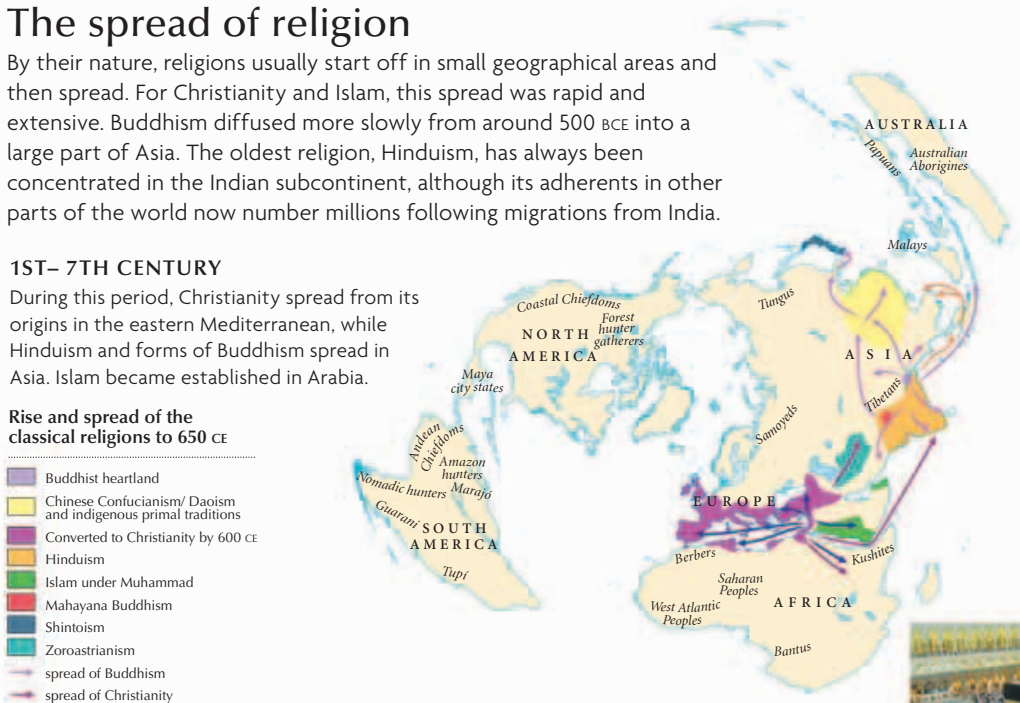
Religion

The spread of religion

By their nature, religions usually start off in small geographical areas and then spread. For Christianity and Islam, this spread was rapid and extensive. Buddhism diffused more slowly from around 500 BCE into a large part of Asia. The oldest religion, Hinduism, has always been concentrated in the Indian subcontinent, although its adherents in other parts of the world now number millions following migrations from India.

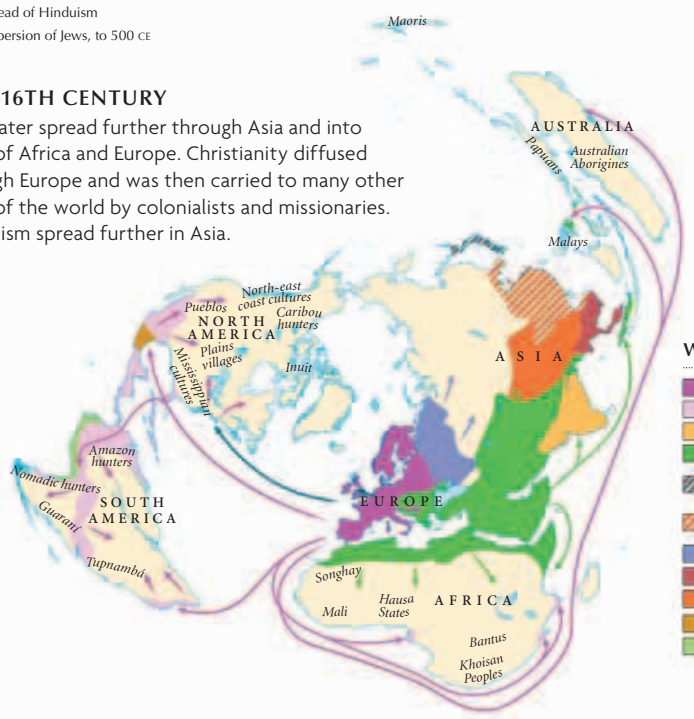
1ST– 7TH CENTURY

During this period, Christianity spread from its origins in the eastern Mediterranean, while Hinduism and forms of Buddhism spread in Asia. Islam became established in Arabia.



7TH–16TH CENTURY

Islam later spread further through Asia and into parts of Africa and Europe. Christianity diffused through Europe and was then carried to many other parts of the world by colonialists and missionaries. Buddhism spread further in Asia.

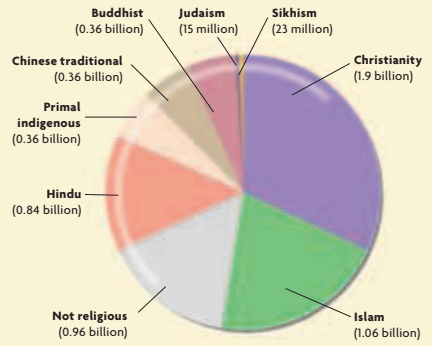


About 83 percent of the world's population adheres to a religion. The remainder adopt irreligious stances such as atheism. In terms of broad similarities of belief, there are about 20 different religions in the world with more than 1 million adherents. However, the larger of these are split into several denominations, which differ in their exact beliefs and practices. Christianity, for example, includes three major groupings that have historically been in conflict—Roman Catholicism, Protestantism, and Orthodox Christianity—as well as hundreds of separate smaller groups. Many of the world's other main religious, such as Islam and Buddhism, are also subdivided.

Each year millions of Muslims visit Mecca during the the Islamic pilgrimage known as the *Hajj*

RELIGION AROUND THE WORLD

About 72 percent of humanity adheres to one of five religions: Christianity, Islam, Hinduism, Buddhism, and Chinese traditional religion (which includes Daoism and Confucianism). Of the remainder, many are adherents of primal indigenous religions (a wide range of tribal or folk religions such as shamanism).



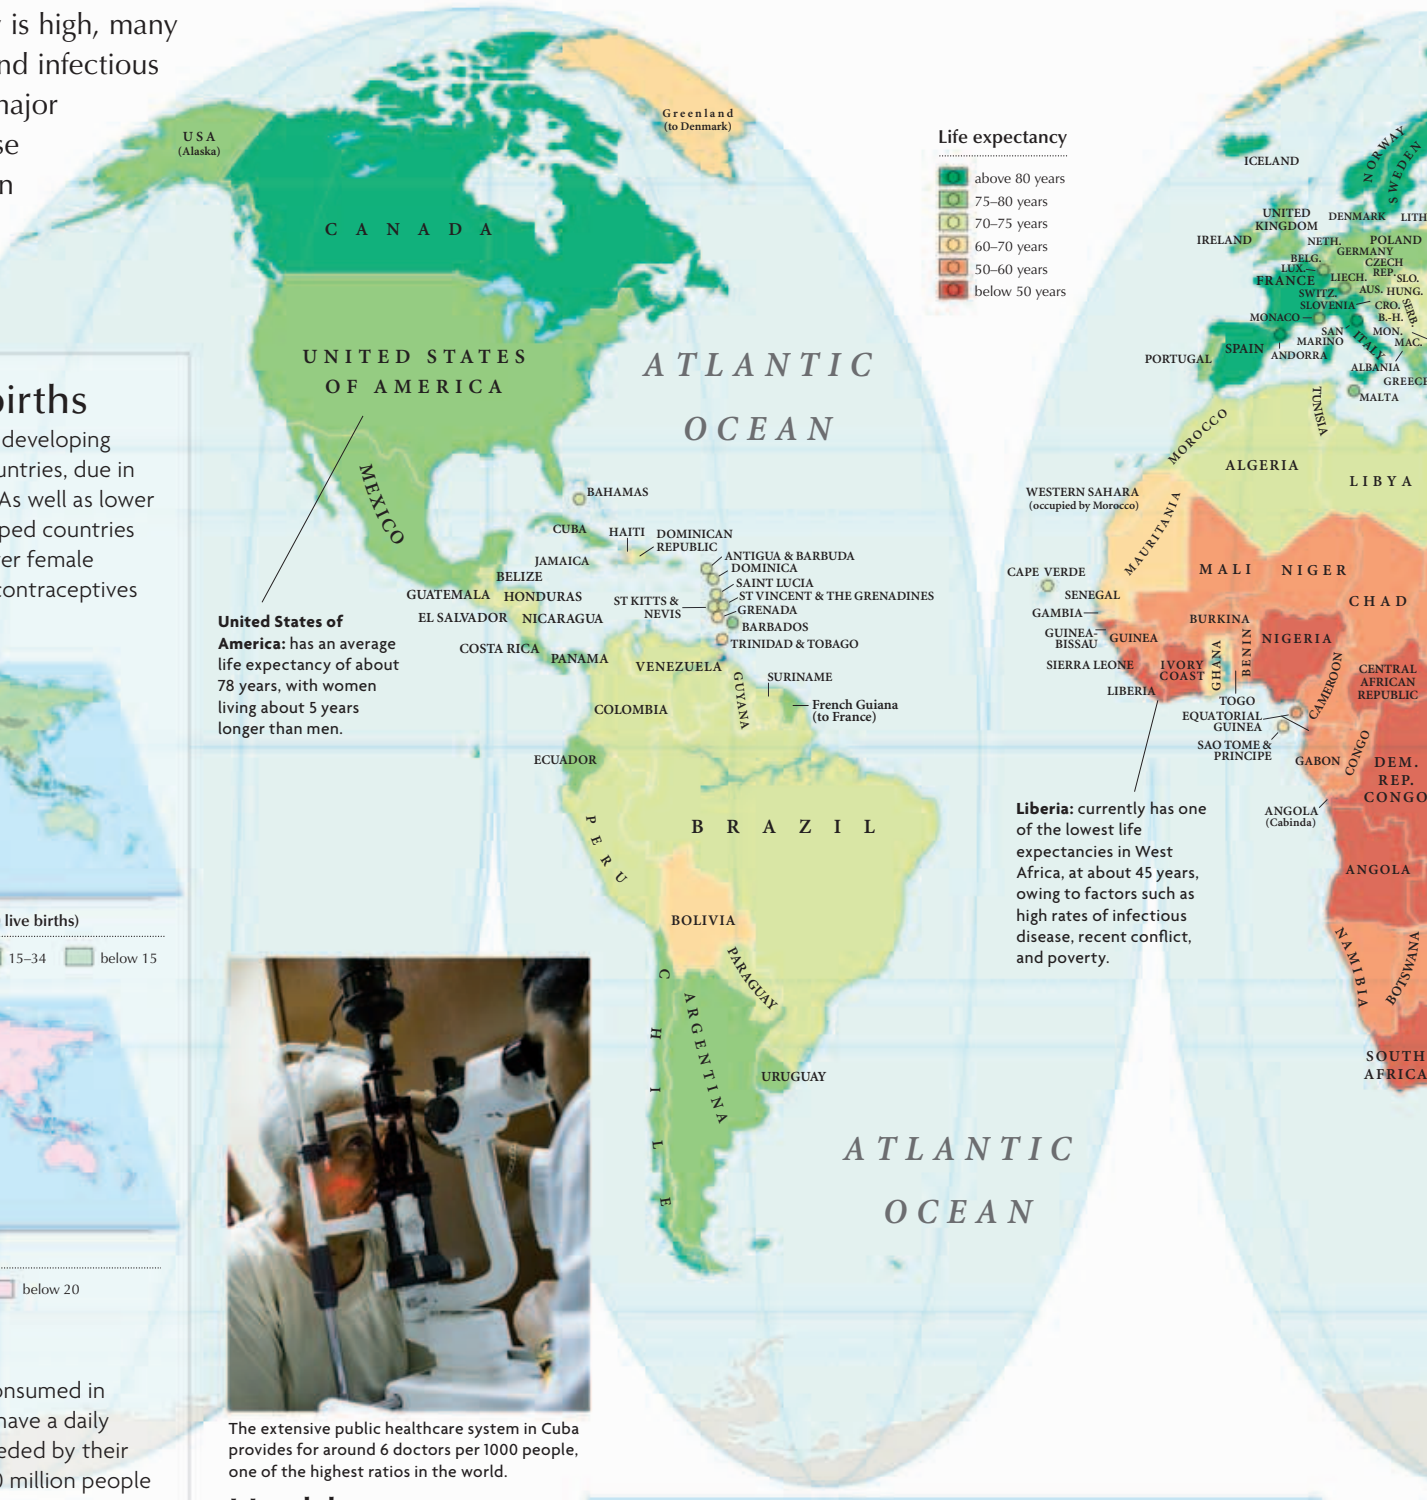
Health

On most health parameters, the countries of the world split into two distinct groups. The first of these encompass the richer, developed, countries, where medical care is good to excellent, infant mortality and the incidence of deadly infectious diseases is low, and life expectancy is high and rising. Some of the biggest health problems in these countries arise from overeating, while the two main causes of death are heart disease and cancer. The second region consists of the poorer developing countries, where medical care is much less adequate, infant mortality is high, many people are undernourished, and infectious diseases such as malaria are major killers. Life expectancy in these countries is much lower and in some cases is falling.

Life expectancy

Life expectancy has risen remarkably in developed countries over the past 50 years and has now topped 80 years in many of them. In contrast, life expectancy in many of the countries of sub-Saharan Africa has fallen well below 50, in large part due to the high prevalence of HIV/AIDS.

Many people in developed countries are now living for 15–20 years after retirement, putting greater pressure on welfare and health services.



United States of America: has an average life expectancy of about 78 years, with women living about 5 years longer than men.

Liberia: currently has one of the lowest life expectancies in West Africa, at about 45 years, owing to factors such as high rates of infectious disease, recent conflict, and poverty.

Infant deaths and births

Infant mortality is still high in many developing nations, especially some African countries, due in part to stretched medical services. As well as lower infant mortality, the world's developed countries have much lower birth rates—greater female emancipation and easier access to contraceptives are two causative factors.

World infant mortality rates (deaths per 1000 live births)

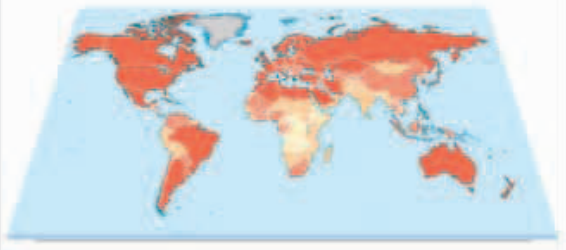
above 125 | 75–124 | 35–74 | 15–34 | below 15

Number of births (per 1000 people)

above 40 | 30–39 | 20–29 | below 20

Nutrition

Two-thirds of the world's food is consumed in developed nations, many of which have a daily calorific intake far higher than is needed by their populations. By contrast, about 800 million people in the developing world do not have enough food to meet basic nutritional needs.



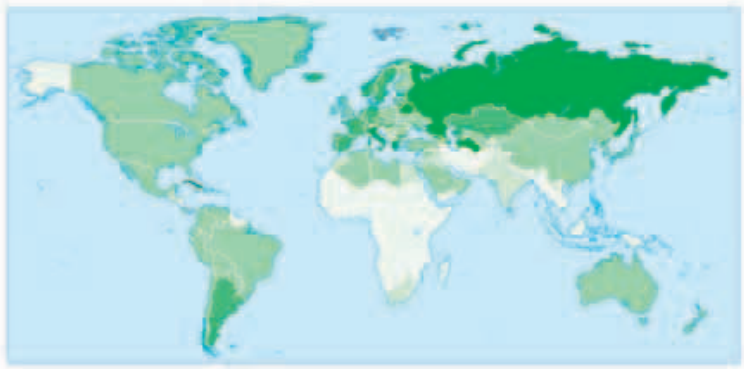
Daily calorie intake per capita

above 3000 | 2500–2999 | 2000–2499 | below 2000

The extensive public healthcare system in Cuba provides for around 6 doctors per 1000 people, one of the highest ratios in the world.

Healthcare

An indicator of the strength of healthcare provision in a country is the number of doctors per 1000 population. Some communist and former communist countries such as Cuba and Russia score well in this regard. In general, healthcare provision is good or adequate in most of the world's richer countries but scanty throughout much of Africa and in parts of Asia and Latin America.

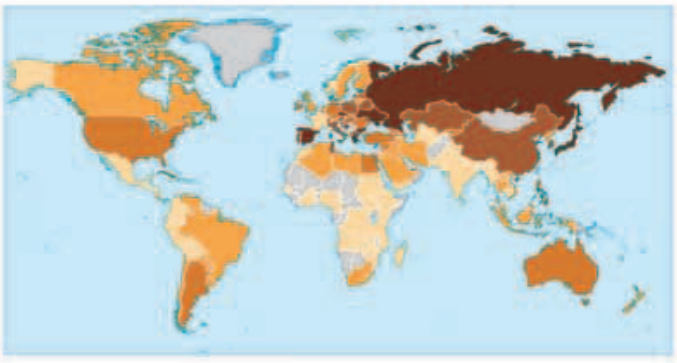


Medical doctors (per 1000 people)

above 5 | 4–5 | 3–4 | 1–3 | 0.5–1 | below 0.5 | no data

Smoking

Cigarette smoking—one of the most harmful activities to health—is common throughout much of the world. Smoking prevalence is generally highest in the richer, developed countries. However, awareness of the health risks has seen cigarette consumption in most of these countries stabilize or begin to fall. By contrast, more and more people, especially males, are taking up the habit in poorer developing countries.



Annual cigarette consumption (per person)

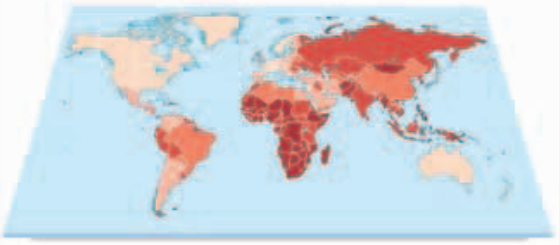
above 2000 | 1500–2000 | 1000–1499 | 500–999 | 0–499 | no data

Japan: has one of the world's highest life expectancies, at over 81 years—a fact commonly put down to the typical Japanese low-fat diet of rice, fish, and soy products.

Swaziland: currently has the lowest life expectancy in the world, at about 40 years, due to widespread HIV/AIDS.

Communicable diseases

Despite advances in their treatment and prevention, infectious diseases remain a huge problem, especially in developing countries. Three of the most common and deadly are tuberculosis (TB), HIV/AIDS, and malaria. Of these, active TB affects about 25 million people (often as a complication of AIDS), with a particularly high prevalence in parts of Africa. HIV/AIDS has spread since 1981 to become a global pandemic. Malaria affects about 225 million people every year.



Estimated tuberculosis cases (per 100,000 per year)

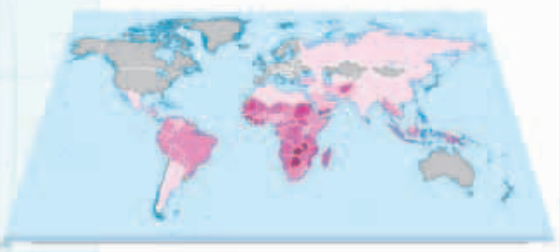
Adult (15-49) HIV prevalence rate (percent of population)

15–34 | 5–15 | 1–5 | 0.5–1 | 0.1–0.5 | below 0.1 | no data



Malaria cases (per 100,000 per year)

above 25,000 | 10,000–25,000 | 1000–10,000 | 100–1000 | 10–100 | below 10 | low risk

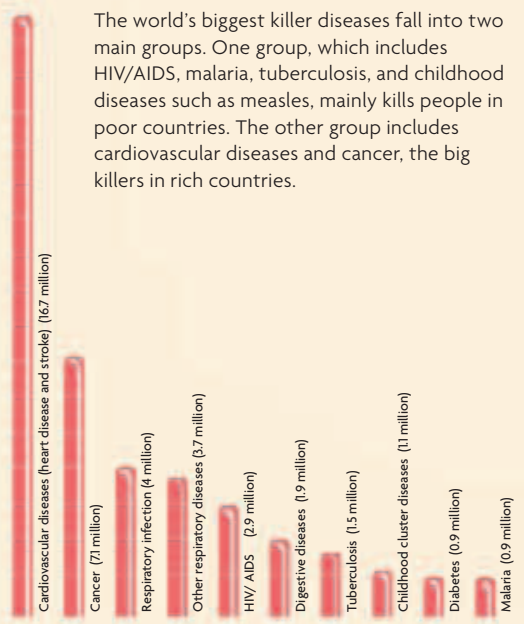
Preventive medicine

Throughout the world, doctors recognize that the prevention of disease and disease transmission is just as important as the treatment of illness. Preventive medicine has many aspects and includes advice about diet and nutrition; education about the avoidance of health-threatening behaviors such as smoking, excess alcohol consumption, and unprotected sex; and the use of vaccines against diseases such as typhoid, polio and cholera. In developing countries, some of the main priorities in preventive medicine are the provision of pure water supplies and proper sanitation, as well as measures against malaria, including the use of antimalarial drugs and mosquito nets.

The use of mosquito nets greatly reduces the transmission of malaria and the risk of infection.

TOP TEN KILLER DISEASES, 2004

The world's biggest killer diseases fall into two main groups. One group, which includes HIV/AIDS, malaria, tuberculosis, and childhood diseases such as measles, mainly kills people in poor countries. The other group includes cardiovascular diseases and cancer, the big killers in rich countries.



Water Resources

Water covers 71 percent of Earth's surface, but only 2.5 percent of this is fresh water, and two thirds of that is locked up in glaciers and polar ice sheets. Patterns of human settlement have developed around fresh water availability, but increasing numbers of people are now vulnerable to chronic shortage or interruptions in supply. Worldwide, fresh water consumption multiplied more than sixfold during the 20th century as populations increased and agriculture became more dependent on irrigation, much of it hugely wasteful because of evaporation and run-off. Industrial water demand also rose, as did use in the home, for washing, flushing, cooking, and gardening.

Amid the desert of Wadi Rum, Jordan, crops grow on circular patches of land irrigated with water from an underground aquifer.

Water withdrawal

Agriculture accounts for 70 percent of water consumption worldwide. Industry and domestic use each account for 15 percent. Excessive withdrawal of water affects the health of rivers and the needs of people. China's Yellow River now fails to reach the sea for most of the year.

Percentage of freshwater withdrawal by agriculture

79–100 66–79 47–66 31–47 16–31 0–16

- 13,000 or more (**plentiful supplies**)
- major drainage basin
- over 50% of water resource originating from outside country

Drought

The disruption of normal rainfall patterns can cause drought problems even in temperate zones, with consequences ranging from domestic water usage restrictions to low crop yields to forest fires. In regions of the developing world where monsoon rains fail, or water is perennially scarce, drought is a life or death issue. Parts of central and east Africa, for instance, have suffered severe and recurring droughts in recent decades, with disastrous results including destruction of livestock, desertification, famine, and mass migration.

In a severe drought, river beds may dry up *(above left)*, leaving stranded fish to die, as here in Florida.

A Chinese farmer waters dry fields *(above)* in China's southern province of Guangdong. This picture was taken in May 2002, but the image is timeless; it could be August 2006 in Sichuan province, to the northwest of here—or almost any year in water-stressed northern China.

Water stress

A region is under "water stress" when the rate of water withdrawal from its rivers and aquifers exceeds their natural replenishment, so that people living there are subject to frequent shortages. Currently 1.7 billion people live in "highly stressed" river basins worldwide. This is a major potential cause of conflict, particularly when several countries share one river; the Euphrates, running through Turkey, Syria, and Iraq, or the rivers of southern China running south into Korea, are just two examples.

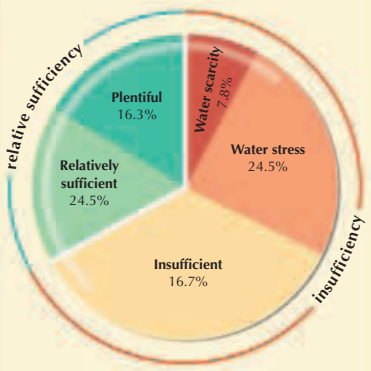
WATER AVAILABILITY

(by percentage of world's population)

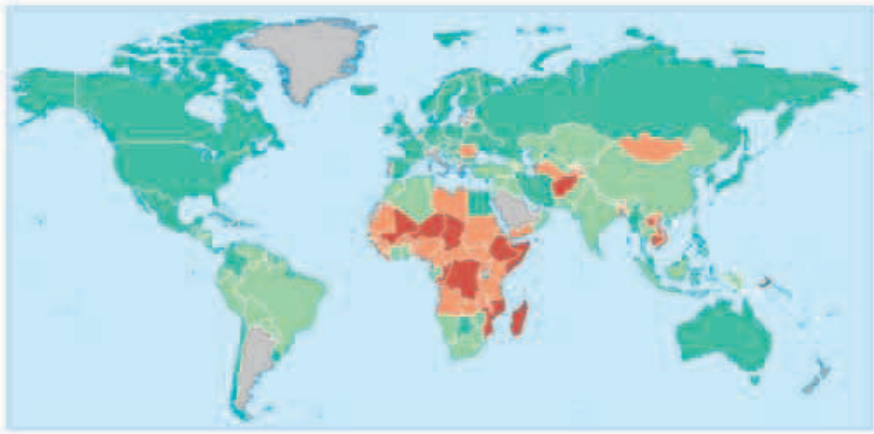


Mozambican children *(above)* fetch precious water in metal pans.

Gujarati villagers gather to draw water from a huge well *(above left)* in Natwarghad, western India. Many wells and village ponds ran dry in the severe drought of 2003, leaving local people to wait for irregular supplies brought in by state-run tankers.

Clean drinking water

Sub-Saharan Africa is among the most deprived regions for lack of access to safe drinking water. Worldwide, this terrible health hazard affects over a billion people—at least 15 percent of the population. One of the agreed United Nations "millennium goals" for international development is to halve this proportion by 2015, by tackling chemical pollution from agriculture and industry, and by introducing essential purification facilities and local supply systems. In the industrialized world, people have come to expect clean drinking water on tap, even if they face rising prices for its treatment and supply.



Access to safe drinking water source
(percentage of population)

91%–100% | 76%–90% | 50%–75% | below 50% | no data

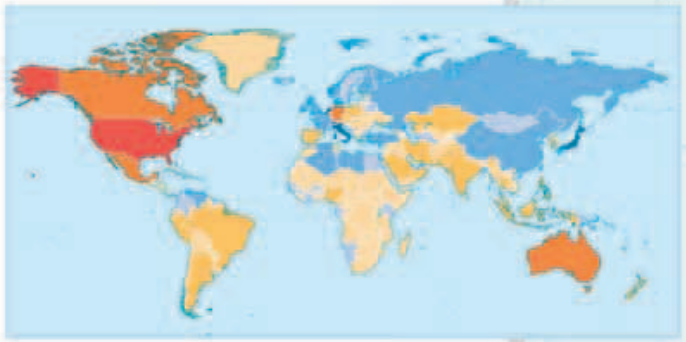
Economic Systems

The world economy is now effectively a single global system based on "free market" capitalist principles. Few countries still cling, like North Korea, to the "command economy" formula developed in the former communist bloc, where centralized state plans set targets for investment and production. In the West, state ownership of companies has greatly diminished thanks to the wave of privatization in the last 25 years. Major companies move capital and raw materials around the globe to take advantage of different labor costs and skills. The World Trade Organization (WTO) promotes free trade, but many countries still use subsidies, and protect their markets with import tariffs or quotas, to favor their own producers.

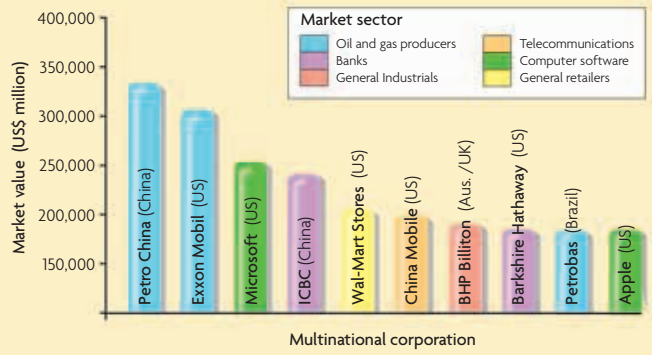
Enormous volumes of trade pass through the world's stock markets making them key indicators of the strength of the global economy.

Balance of trade

Few countries earn from their exports exactly as much as they spend on imports. If the imbalance is persistently negative, it creates a potentially serious problem of indebtedness. The European Union's (EU) external trade is broadly in balance, but the US balance of trade has been in deficit since the 1970s, partly because it imports so many consumer goods. This deficit now stands at around US$ 500 billion a year.



TOP TEN GLOBAL COMPANIES (2010)



Energy

Countries with oil and gas to sell (notably in the Middle East and Russia) can charge high prices; trade in fuel was worth US$ 1.4 trillion in 2005. The US and others are turning back to nuclear power (despite safety fears) for generating electricity. China relies heavily on (polluting) coal. Renewable technologies promise much, but so far make relatively minor contributions.

International debt

Saddled with crippling debts from past borrowing, the world's poorest countries are still paying off US $100 million a day. This is despite recent successful campaigns to get some of their debts cancelled to allow them to use their limited resources for development. Most international debt, however, is owed by developed countries to one another. The US owes just over a trillion dollars, around 7% of its total debt, to China.

Gross Domestic Product (GDP) by continent (US$ billion)

Trade sector

World trade in merchandise tops US$ 10 trillion a year. The global pattern is uneven. Latin America, Africa, the Middle East, and Russia principally export "primary" goods (agricultural produce, mining and fuel). The "secondary" manufacturing sector includes iron and steel, machine tools, chemicals, clothing and textiles, cars and other consumer goods. The West still dominates the "tertiary" or non-merchandise sector, worth US$ 2.4 trillion, in services such as insurance and banking.

Labor

China's huge low-cost labor force promotes its conquest of world markets for manufactured goods. India's educated workforce attracts call centers and other service sector jobs, while the more economically developed countries's (MEDC) caring professions, and low-wage agriculture, draw in immigrant labor.

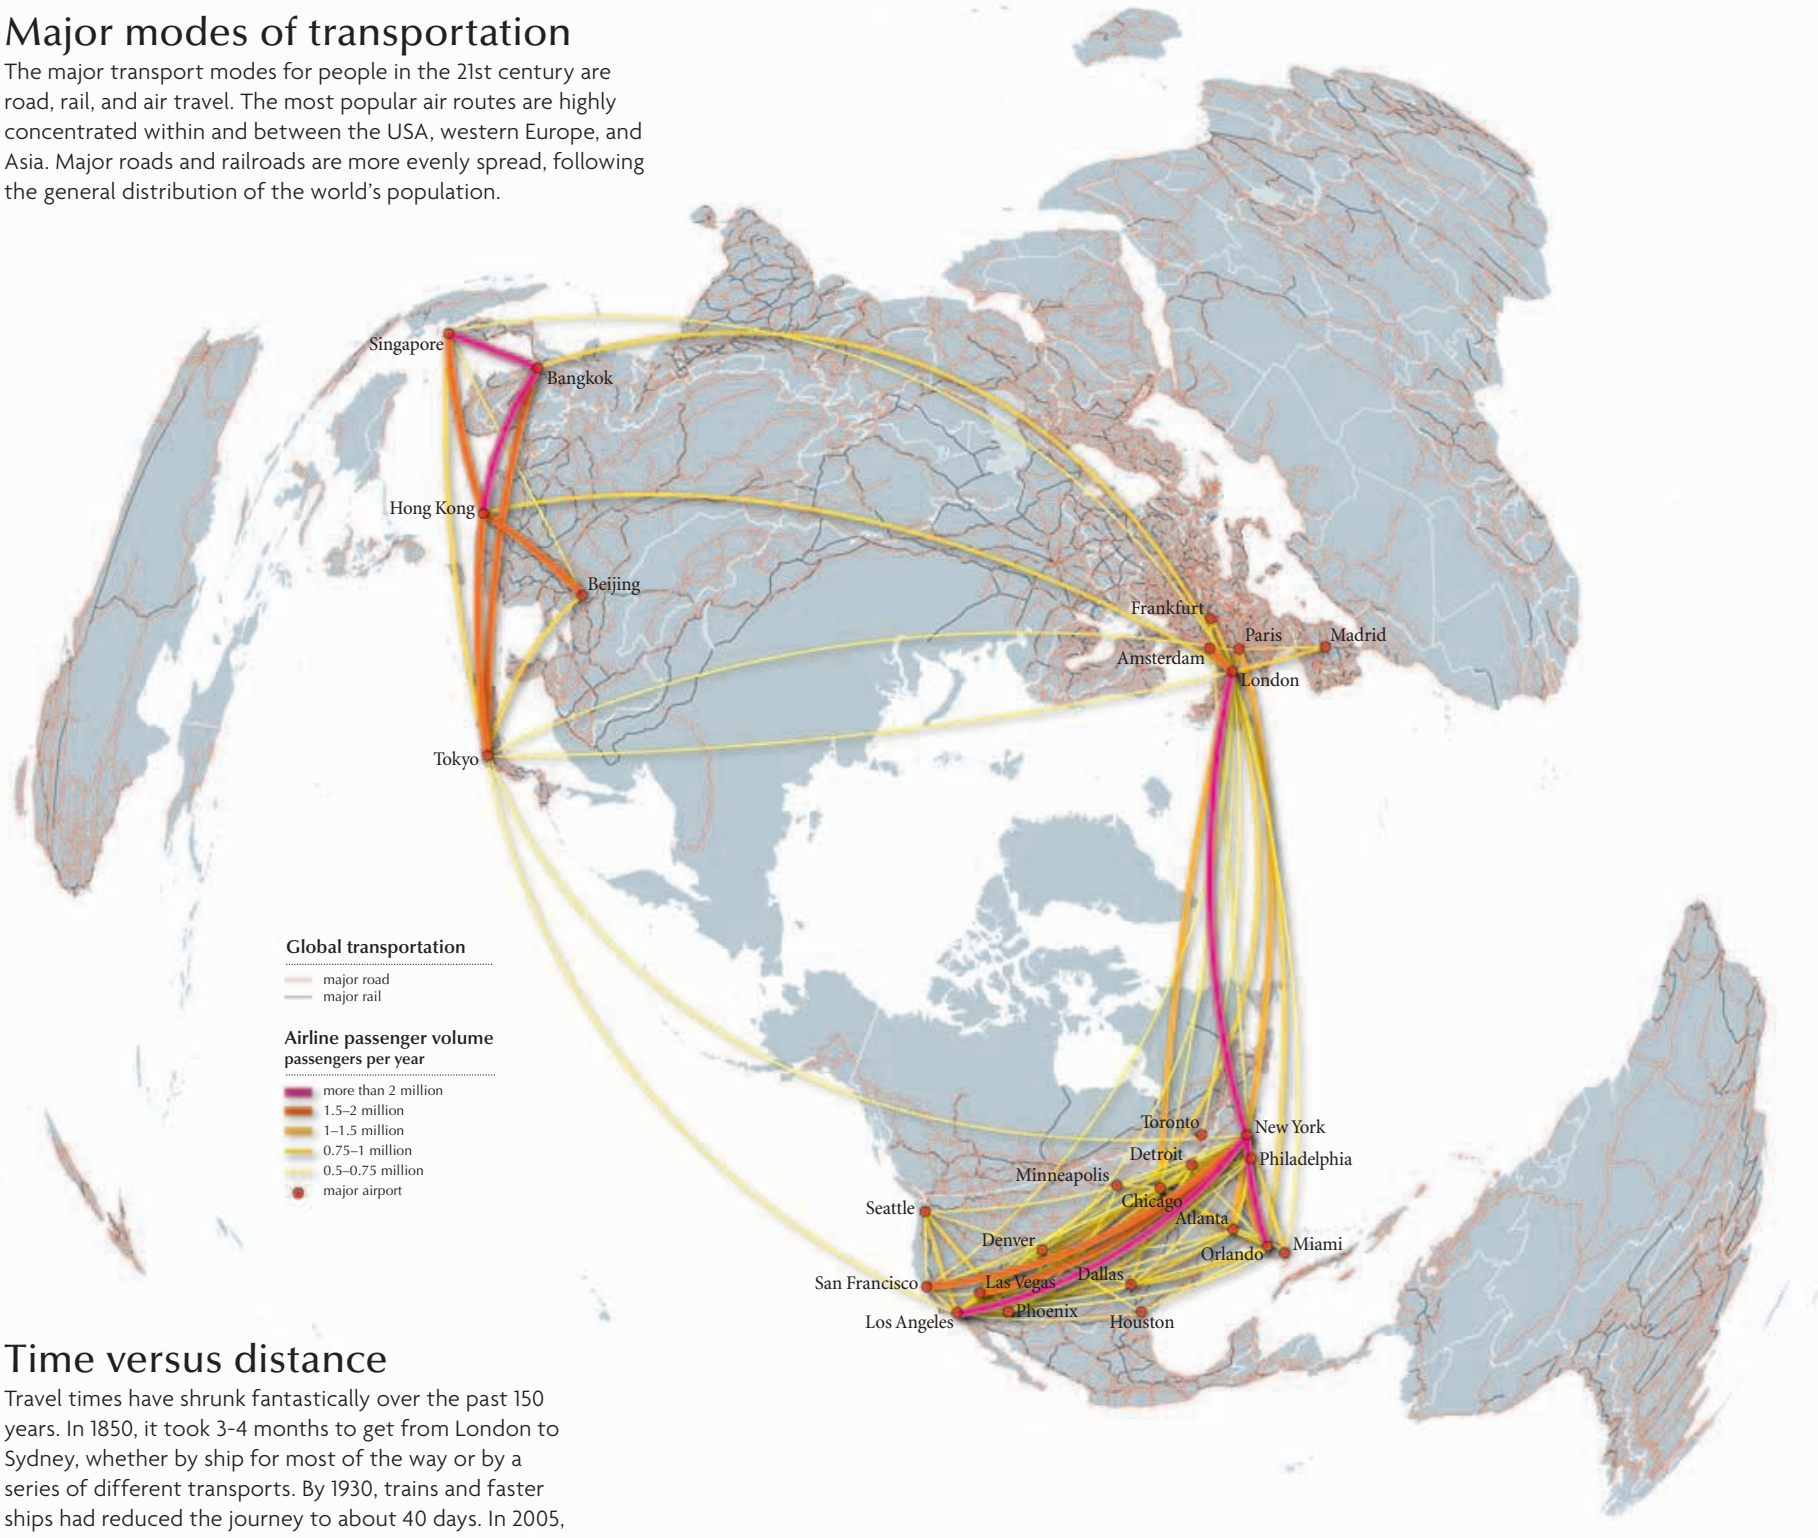
Travel

Mass travel is now a ubiquitous feature of all developed countries, and the provision of transport and tourism facilities one of the world's biggest industries, employing well over 100 million people. The travel explosion has come about, first, through major improvements in transportation technology; and second, as a result of increasing amounts of disposable income and leisure time in the world's wealthier countries. The main reasons for travel today include leisure pursuits and tourism (accounting for well over half of the total financial outlay), work and business, pilgrimage, migration, and visits to family and friends.

There are currently around 4.2 billion air travelers a year passing through over 1600 international and domestic airports. This figure is forecast to grow by 4 percent each year, leading to increased pressure on air traffic control and ground handling systems that, in many areas, are already close to maximum capacity.

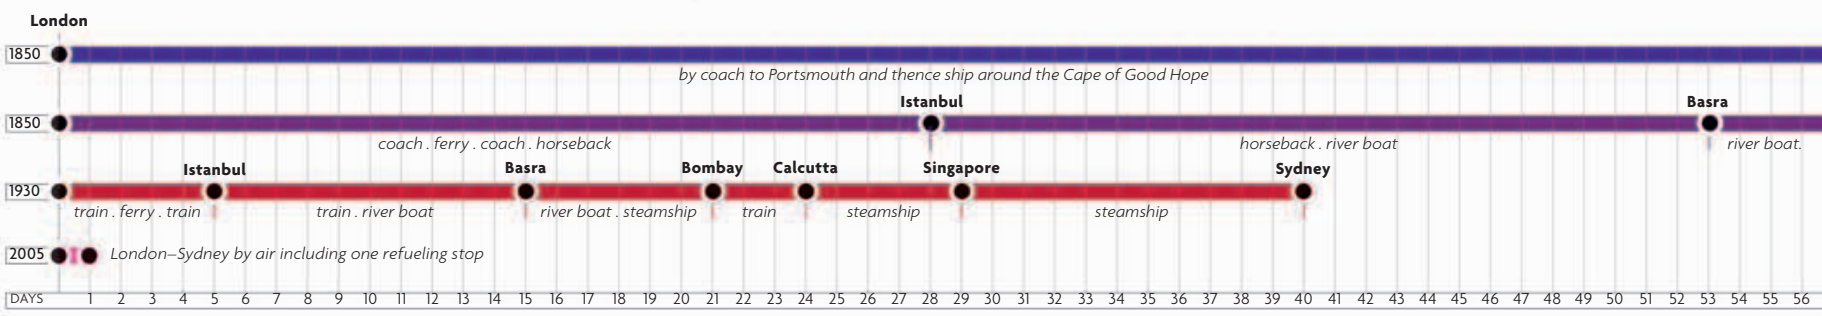
Major modes of transportation

The major transport modes for people in the 21st century are road, rail, and air travel. The most popular air routes are highly concentrated within and between the USA, western Europe, and Asia. Major roads and railroads are more evenly spread, following the general distribution of the world's population.



Time versus distance

Travel times have shrunk fantastically over the past 150 years. In 1850, it took 3-4 months to get from London to Sydney, whether by ship for most of the way or by a series of different transports. By 1930, trains and faster ships had reduced the journey to about 40 days. In 2005, the trip took just 21 hours by air.

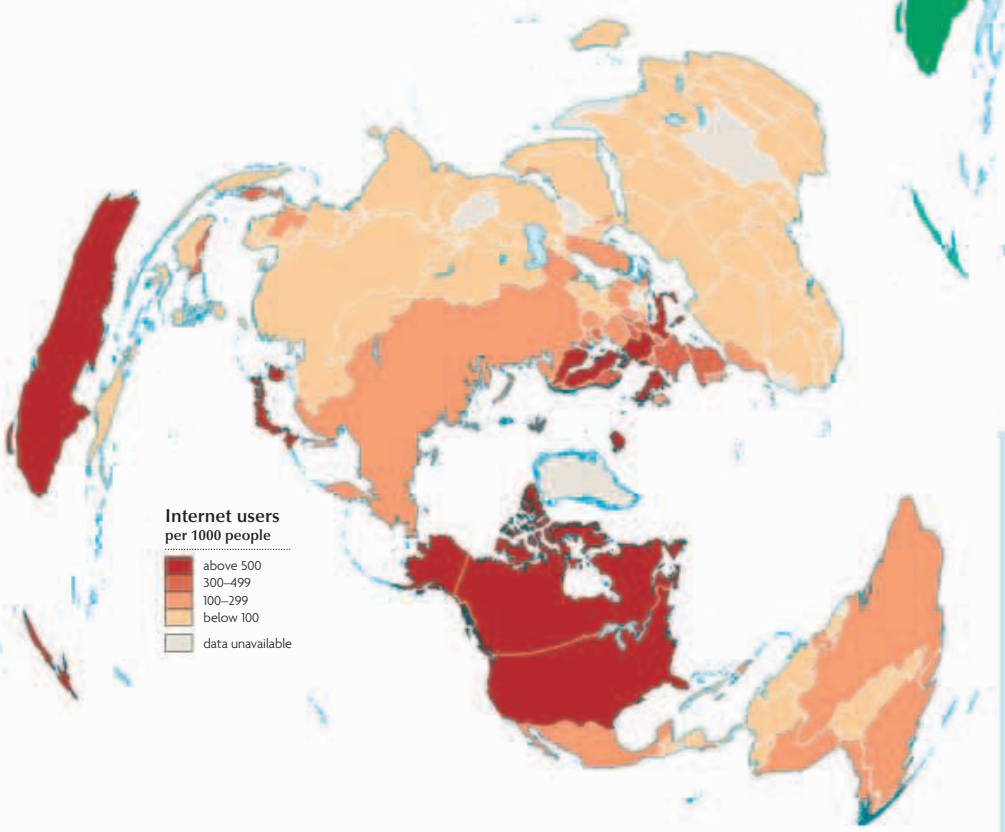


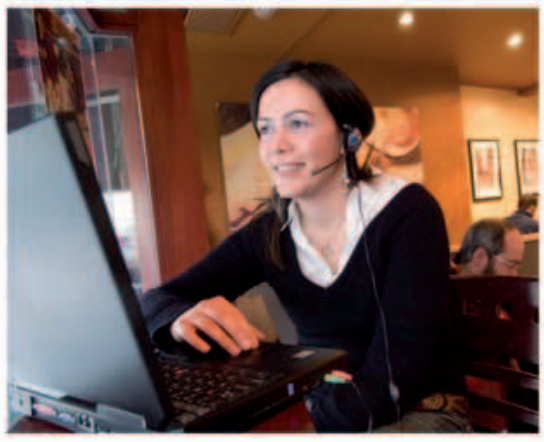
Media and Communications

Over the past 50 years, the term "media" has come to denote various means of communicating information between people at a distance. These include mass media—methods such as newspapers, radio, and television that can be used to rapidly disseminate information to large numbers of people—and two-way systems, such as telephones and e-mail. Currently, the communication systems undergoing the most rapid growth worldwide include mobile telephony and various Internet-based applications, such as web sites, blogs, and podcasting, which can be considered forms of mass media.

Internet usage

Internet usage has grown extremely rapidly since the early 1990s, largely as a result of the invention of the World Wide Web. Usage rates are highest in the USA (where about 80 percent of people were using the Internet in 2006), Australia, Japan, South Korea, and Finland. They are lowest in Africa, where on average less than 5 percent of the population were Internet users in 2006.





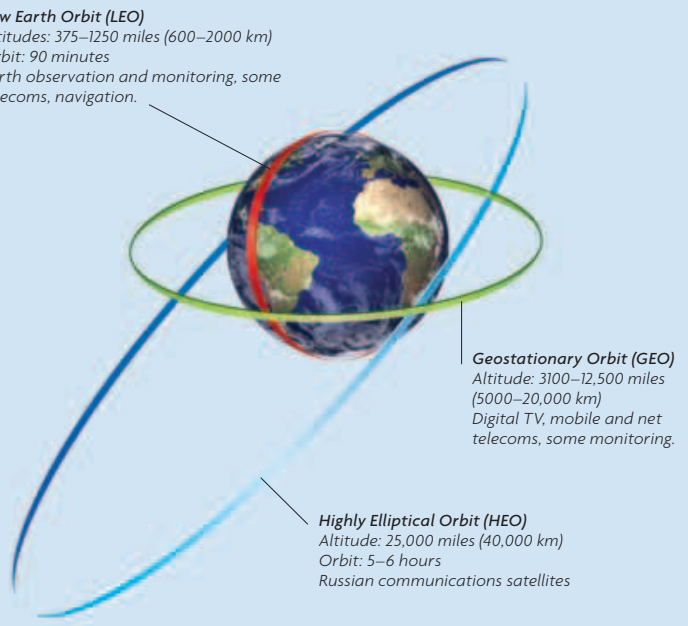
The internet emerged in the early 1990s as a computer-based global communication system. Since then massive growth has seen user numbers increase to around 1.1 billion people, or roughly 17 percent of the world's population.

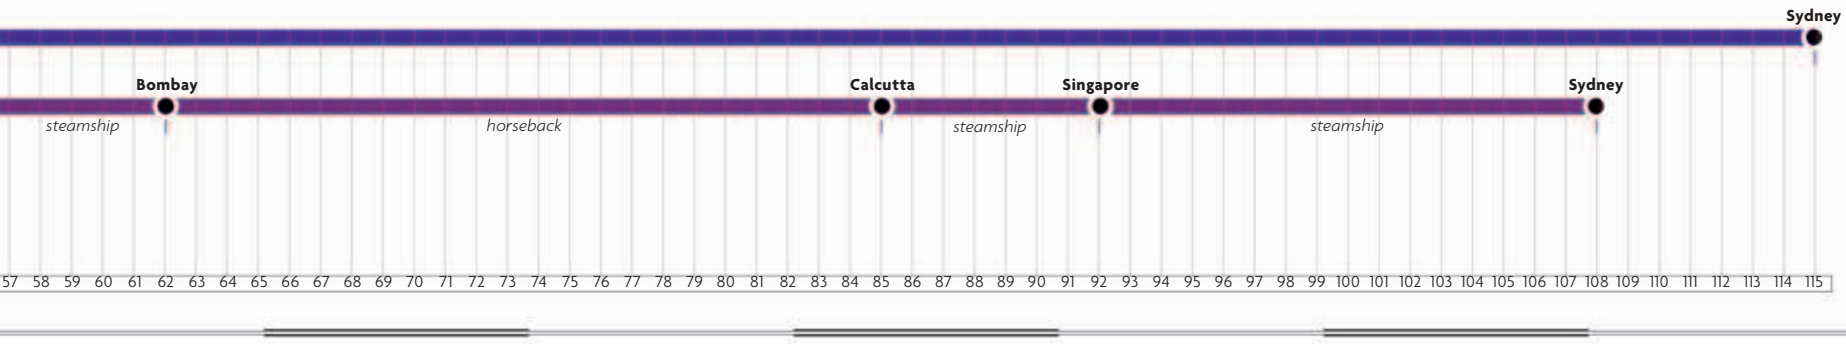
Mobile phone usage

By 2006, there were more than 2.5 billion mobile phone users worldwide. In some parts of Europe, such as Italy, almost everyone owns and uses a mobile—many possess more than one phone. In contrast, throughout much of Southern Asia and Africa, less than 10 percent of the population are users. As well as utilizing them as telephones, most users now employ the devices for the additional functions they offer, such as text messaging and e-mail.

Satellite Communications

Modern communications satellites are used extensively for international telephony, for television and radio broadcasting, and to some extent for transmitting Internet data. Many of these satellites are deployed in clusters or arrays, often in geostationary orbits—that is, in positions that appear fixed to Earth-based observers.





The Political World

Today's world map shows nearly 200 independent states, compared with about 80 after World War II. The transformation is mainly due to the withdrawal of European powers from huge colonial empires; their remaining overseas dependencies are tiny by comparison. The late 20th century also saw the collapse of communism, realignment in Europe, and fragmentation in former Yugoslavia. Globally, the Soviet Union's demise left the USA as the sole superpower, though with fast-growing China and India emerging as economic giants of the future. US security preoccupations switched to combating terrorism, while looming oil and other resource shortages, and environmental constraints, underlined the need for more effective international cooperation.

International borders

The world political map of today displays a complex pattern of boundaries that has evolved through history, and is still constantly changing as new countries emerge and disputes and territorial claims are slowly resolved. The map shows two main types of border. Full borders represent internationally agreed and recognized territorial boundaries. A disputed border is indicated where a *de facto* territorial boundary exists, which is not agreed or is still subject to arbitration.

Borders, conflicts and disputes

Conflict evolved in the 20th century from conventional land- or sea-based warfare to increasingly long-range airborne attacks. Nuclear arms from 1945 took this to the intercontinental scale. The Cold War presented a new type of conflict, underlined by the race for weapons capabilities between the US and the Soviet Union. In Korea, Vietnam, the Middle East and elsewhere, soldiers and civilians were exposed to deadly chemicals. International treaties aimed to prevent the spread of nuclear, biological and chemical "weapons of mass destruction". Intercommunal conflict and "ethnic cleansing" reminded the world that horror needed no sophisticated weaponry. After 9/11, the US-led "war on terror" perceived conflict in a new light, where international terrorism knew no borders.

THE PEACEKEEPERS

Over 130 countries have contributed around a million troops to UN missions to monitor peace processes and help implement peace accords since 1948. Regional alliances such as NATO and the African Union (AU) are increasingly deploying their own multinational forces in trouble-spots, while Australia has intervened in a similar manner in nearby Pacific island states. Peacekeepers oversaw East Timor's elections in 2001 and subsequent celebration of independence *(above)*. The US defines many of its activities as peacekeeping, despite the confrontational nature of some of its interventions.

DARFUR

African ethnic minorities in Darfur in western Sudan have suffered appalling violence since 2003 at the hands of genocidal Arab Janjaweed militias, for which the government in Khartoum denies responsibility. Displaced in their hundreds of thousands, refugees receive inadequate protection and aid from an international community unwilling to commit to full-scale intervention.

ISRAEL

Since its creation in 1948, Israel has been at war with its Arab neighbors. The Palestinians are fighting for a separate, viable state, comprising of at least East Jerusalem, and the West Bank and Gaza Strip, territories occupied by Israel in 1967. Their struggle *(intifada)* has attracted international support, but has been met by a hard-line response from Israel, which is backed by the US.

Arab-Israeli Wars 1947-2006

MAIN MAP: Arab-Israeli Wars

- Israel in 1949

Conflicts and international disputes

- Major active territorial or border disputes
- Countries involved in internal conflict
- Active territorial or border disputes and internal conflict

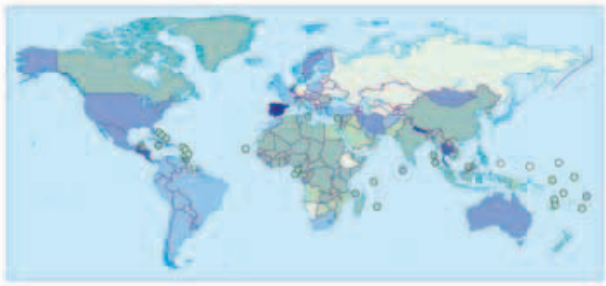
Types of government

- Multiparty democracy for more than 10 yrs
- Multiparty democracy within last 10 yrs
- Single-party government
- Military regime
- Theocracy
- Monarchy
- Non-party system
- Transitional regime

Lines on the map

The determination of international boundaries can use a variety of criteria. Many borders between older states follow physical boundaries, often utilizing natural defensive features. Others have been determined by international agreement or arbitration, or simply ended up where the opposing forces stood at the end of a conflict.

WORLD BOUNDARIES



Dates from which current boundaries have existed

- 1990–present
- 1966–1989
- 1946–1965
- 1915–1945
- 1850–1914
- 1800–1849
- Pre-1800

POST-COLONIAL BORDERS

Independent African countries have largely inherited the earlier carve up of the continent by European colonial powers. These often arbitrarily divided or grouped differing ethnic and religious groups which has, in turn, contributed to the tensions that underlie the many civil conflicts that have plagued post-colonial Africa.

ENCLAVES

Changes to international boundaries occasionally create pockets of land cut off from the main territory of the country they belong to. In Europe, Kaliningrad has been separated from the rest of the Russian Federation since the independence of the Baltic States. Likewise, when Morocco was granted independence, Spain retained the coastal enclaves of Ceuta and Melilla.

GEOMETRIC BORDERS

Straight lines and lines of longitude and latitude have occasionally been used to determine international boundaries: the 49th Parallel forms a large section of the Canada–US border, while the 38th Parallel roughly divides the Korean Peninsula. Internal administrative divisions within Canada, the US, and Australia also use geometric boundaries.

PHYSICAL BORDERS

Rivers account for one-sixth of the world's borders: the Danube forms part of the boundaries for nine European nations. Changes in a river's course or disruption of its flow can lead to territorial disputes. Lakes and mountains also form natural borders.

Lake border *(right)*
Mountain border *(below left)*
River border *(below right)*

GULF CONFLICTS

Although the West armed Saddam Hussein in the brutal 1980s Iran-Iraq War, his unprovoked invasion of Kuwait in 1990 was decried the world over. A US-led coalition, including Arab states, repelled his troops but left him in power. A decade of sanctions followed until, in 2003, Saddam was finally toppled by US-led forces. Following elections in 2005, Iraq has struggled to contain a violent insurgency.

Conflict in the Persian Gulf

- Allied land campaign 2003
- main centres of insurgency 2003–04

The World's Time Zones

The numbers at the top of the map indicate how many hours each time zone is ahead or behind Coordinated Universal Time (UTC). The row of clocks indicate the time in each zone when it is 12:00 noon UTC.

TIME ZONES

Because Earth is a rotating sphere, the Sun shines on only half of its surface at any one time. Thus, it is simultaneously morning, evening and night time in different parts of the world *(see diagram below)*. Because of these disparities, each country or part of a country adheres to a local time. A region of Earth's surface within which a single local time is used is called a time zone. There are 24 one hour time zones around the world, arranged roughly in longitudinal bands.

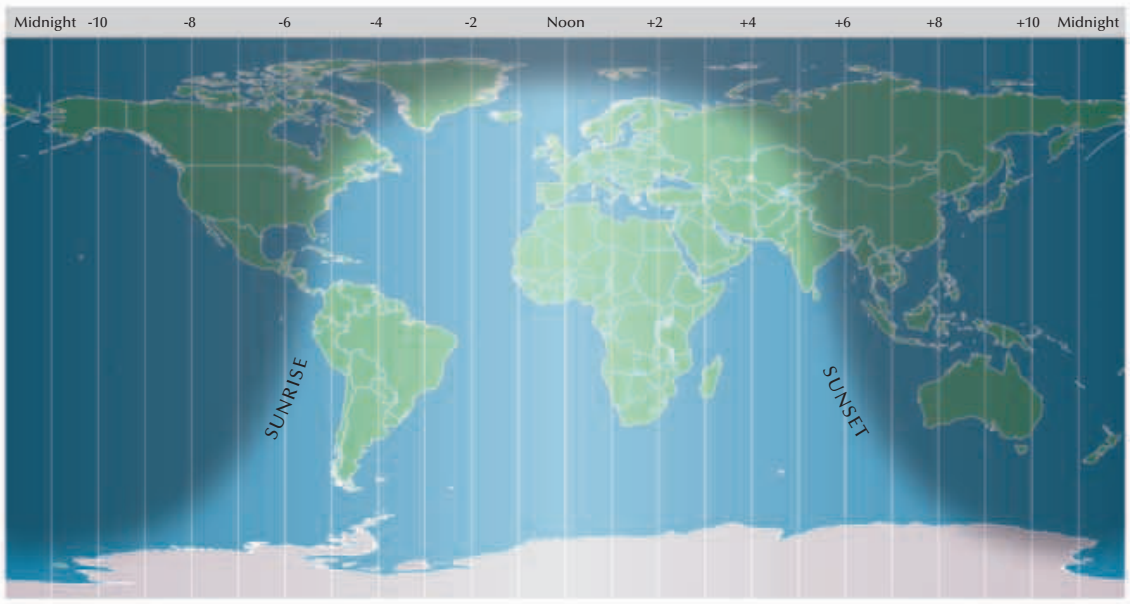
STANDARD TIME

Standard time is the official local time in a particular country or part of a country. It is defined by the time zone or zones associated with that country or region. Although time zones are arranged roughly in longitudinal bands, in many places the borders of a zone do not fall exactly on longitudinal meridians, as can be seen on the map *(above)*, but are determined by geographical factors or by borders between countries or parts of countries. Most countries have just one time zone and one standard time, but some large countries (such as the USA, Canada and Russia) are split between several time zones, so standard time varies across those countries. For example, the coterminous United States straddles four time zones and so has four standard times, called the Eastern, Central, Mountain and Pacific standard times. China is unusual in that just one standard time is used for the whole country, even though it extends across 60° of longitude from west to east.

COORDINATED UNIVERSAL TIME (UTC)

Coordinated Universal Time (UTC) is a reference by which the local time in each time zone is set. For example, Australian Western Standard Time (the local time in Western Australia) is set 8 hours ahead of UTC (it is UTC+8) whereas Eastern Standard Time in the United States is set 5 hours behind UTC (it is UTC-5). UTC is a successor to, and closely approximates, Greenwich Mean Time (GMT). However, UTC is based on an atomic clock, whereas GMT is determined by the Sun's position in the sky relative to the 0° longitudinal meridian, which runs through Greenwich, UK.

DAY AND NIGHT AROUND THE WORLD



In 1884 the Prime Meridian (0° longitude) was defined by the position of the cross-hairs in the eyepiece of the "Transit Circle" telescope in the Meridian Building at the Royal Observatory, Greenwich, UK.

THE INTERNATIONAL DATELINE

The International Dateline is an imaginary line from pole to pole that roughly corresponds to the 180° longitudinal meridian. It is an arbitrary marker between calendar days. The dateline is needed because of the use of local times around the world rather than a single universal time. When moving from west to east across the dateline, travelers have to set their watches back one day. Those traveling in the opposite direction, from east to west, must add a day.

DAYLIGHT SAVING TIME

Daylight saving is a summertime adjustment to the local time in a country or region, designed to cause a higher proportion of its citizens' waking hours to pass during daylight. To follow the system, timepieces are advanced by an hour on a pre-decided date in spring and reverted back in the fall. About half of the world's nations use daylight saving.

COMPLETE ATLAS OF THE WORLD

THE MAPS IN THIS ATLAS ARE ARRANGED CONTINENT BY CONTINENT, STARTING FROM THE INTERNATIONAL DATE LINE, AND MOVING EASTWARD. THE MAPS PROVIDE A UNIQUE VIEW OF TODAY'S WORLD, COMBINING TRADITIONAL CARTOGRAPHIC TECHNIQUES WITH THE LATEST REMOTE-SENSED AND DIGITAL TECHNOLOGY.

NORTH AMERICA

North America is the world's third largest continent with a total area of 9,358,340 sq miles (24,238,000 sq km) including Greenland and the Caribbean islands. It lies wholly within the Northern Hemisphere.

FACTFILE

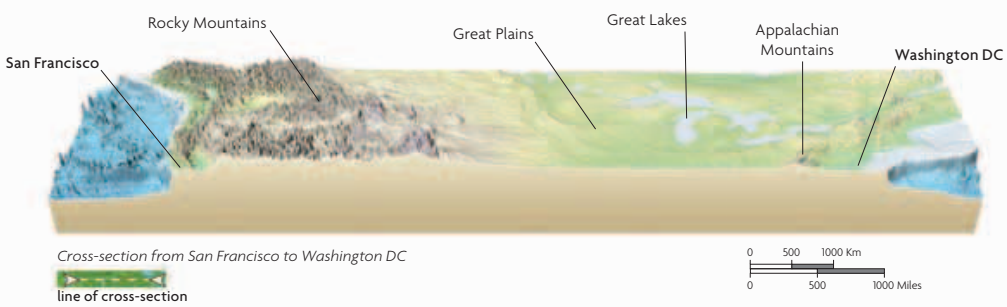
Northice, Greenland -87°F (-66°C)

Wettest Place:
Vancouver, Canada 183 in (4645 mm)

Driest Place:
Death Valley, USA 2 in (50 mm)

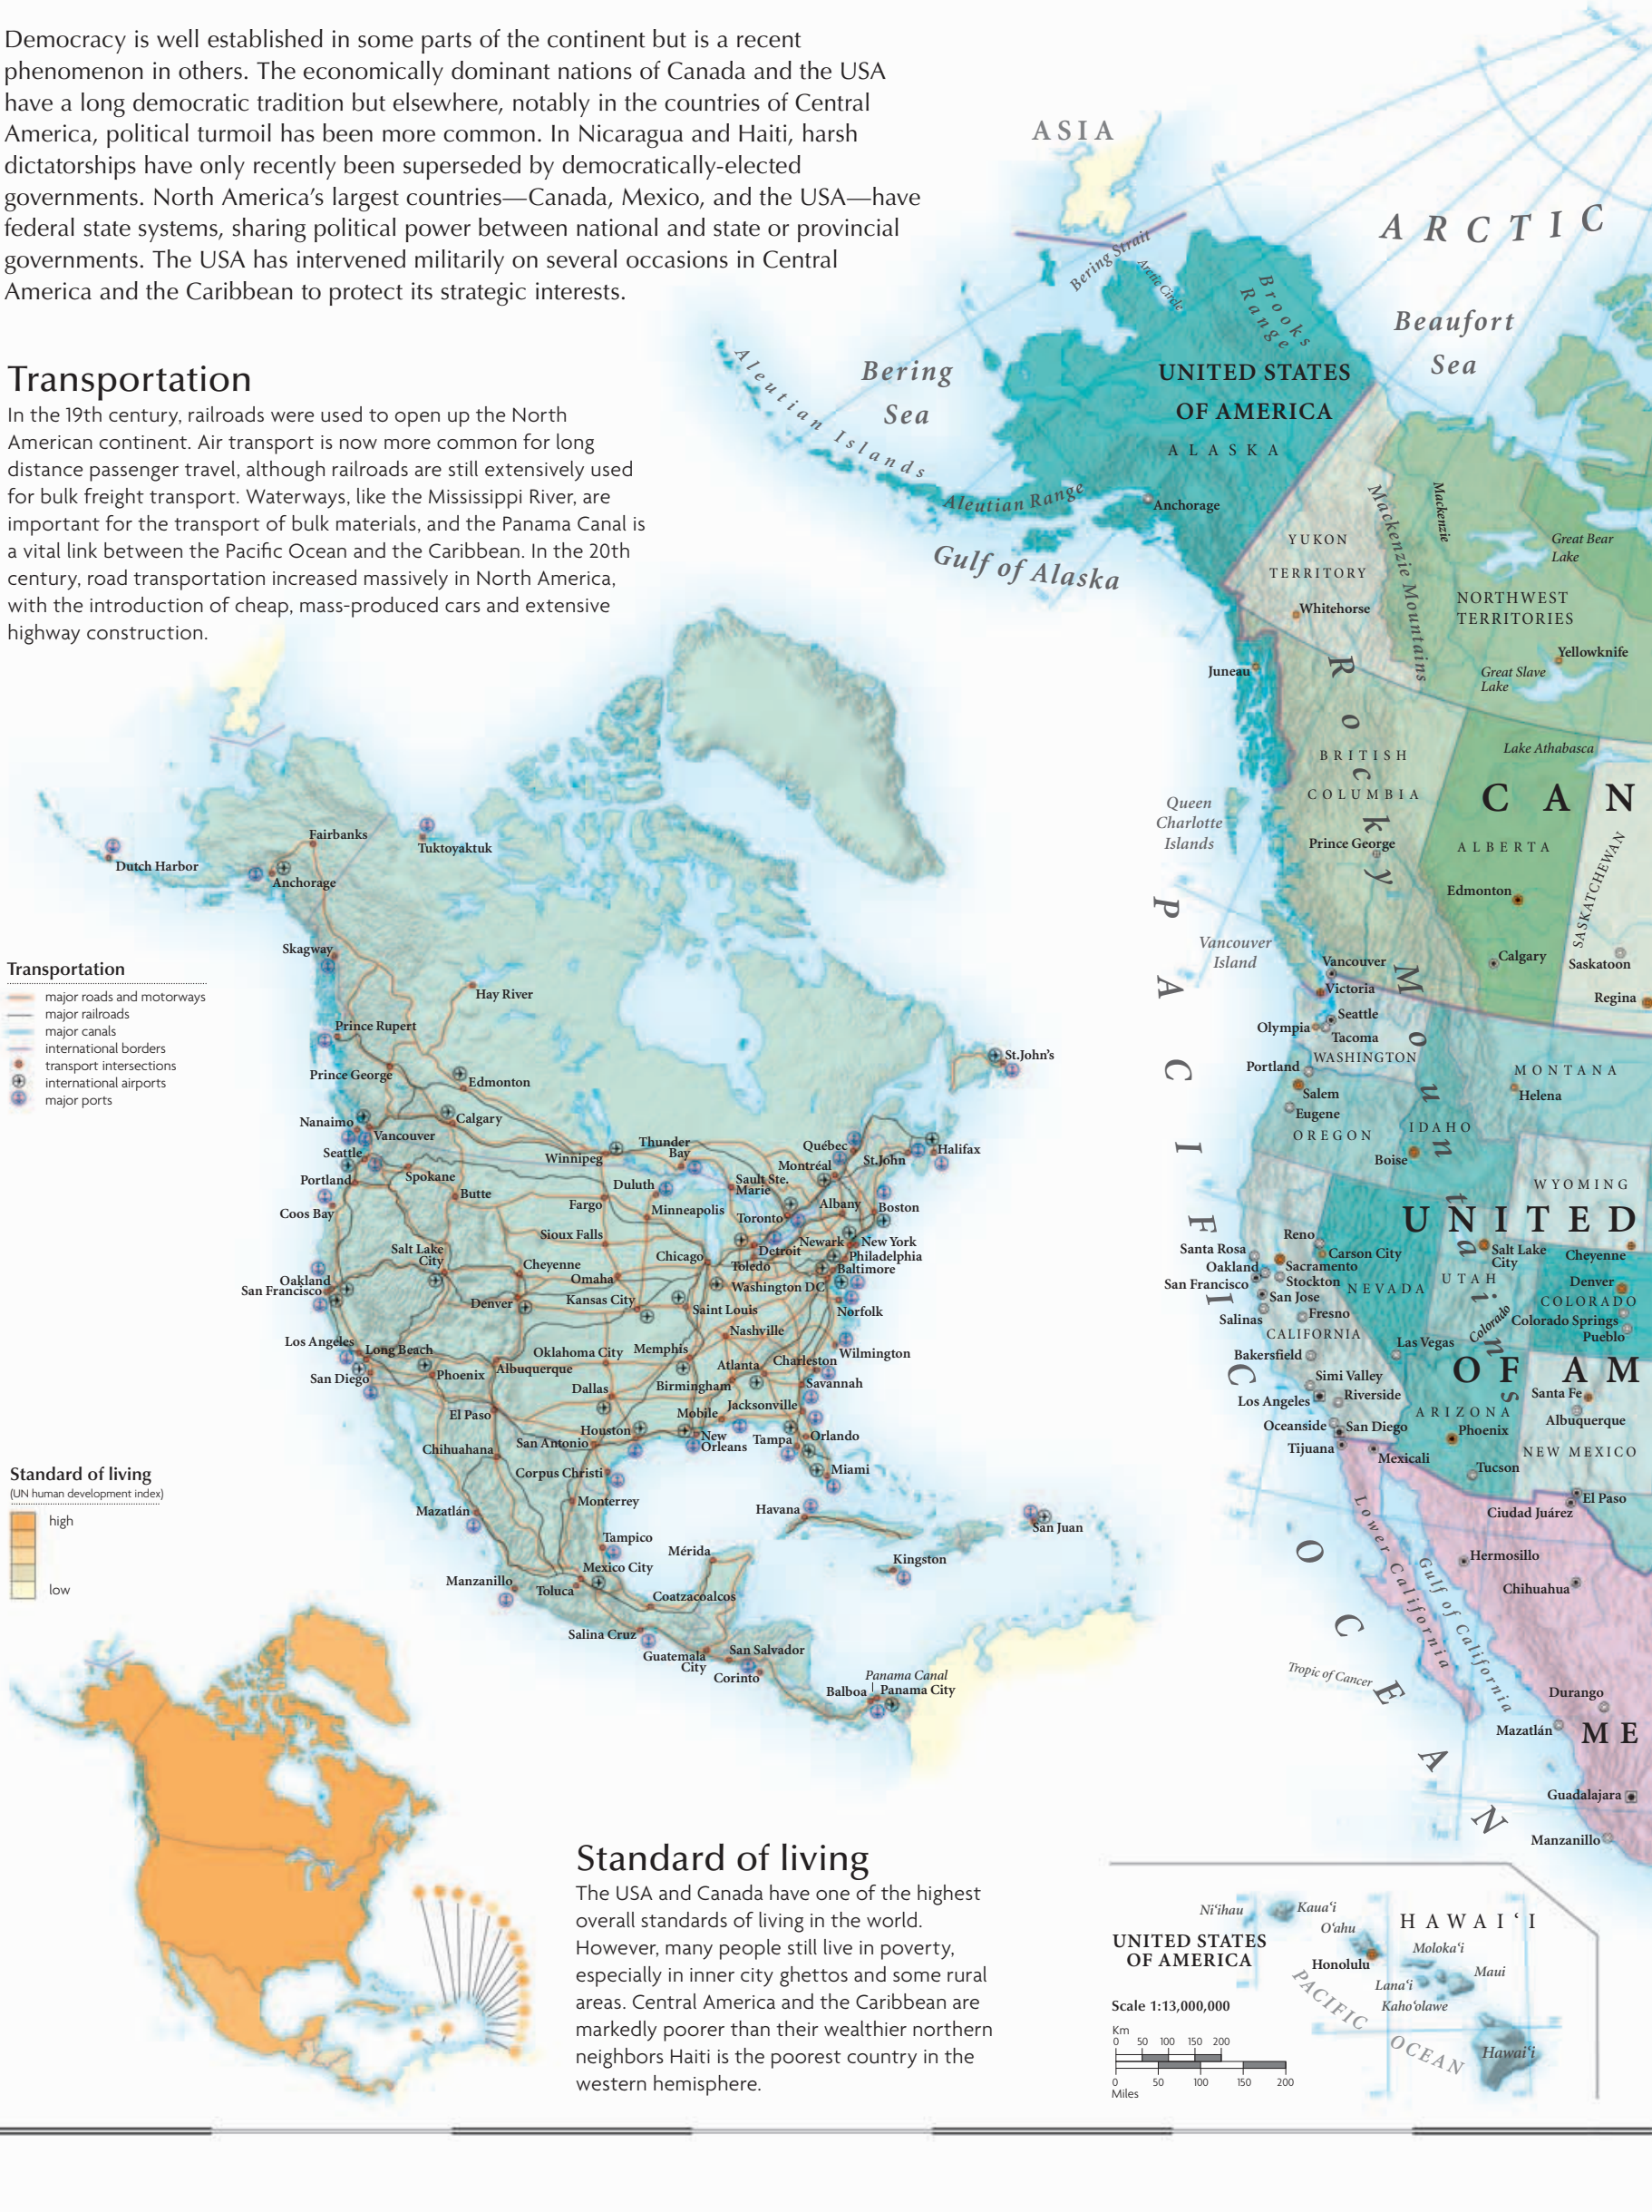


Political

Democracy is well established in some parts of the continent but is a recent phenomenon in others. The economically dominant nations of Canada and the USA have a long democratic tradition but elsewhere, notably in the countries of Central America, political turmoil has been more common. In Nicaragua and Haiti, harsh dictatorships have only recently been superseded by democratically-elected governments. North America's largest countries—Canada, Mexico, and the USA—have federal state systems, sharing political power between national and state or provincial governments. The USA has intervened militarily on several occasions in Central America and the Caribbean to protect its strategic interests.

Transportation

In the 19th century, railroads were used to open up the North American continent. Air transport is now more common for long distance passenger travel, although railroads are still extensively used for bulk freight transport. Waterways, like the Mississippi River, are important for the transport of bulk materials, and the Panama Canal is a vital link between the Pacific Ocean and the Caribbean. In the 20th century, road transportation increased massively in North America, with the introduction of cheap, mass-produced cars and extensive highway construction.



Standard of living

The USA and Canada have one of the highest overall standards of living in the world. However, many people still live in poverty, especially in inner city ghettos and some rural areas. Central America and the Caribbean are markedly poorer than their wealthier northern neighbors Haiti is the poorest country in the western hemisphere.

Languages

The three major official languages of North America are of European origin, brought by settlers in the 16th century. In Canada, French and English are spoken; in the USA, English is the main language, with large Spanish-speaking areas in the southwest; Mexicans are Spanish-speaking; while the Caribbean islands use French, English, and Spanish as well as the hybrid Creole tongues. In isolated areas, languages of the indigenous peoples still exist, such as Inuit in the far north of the continent.

Population

Much of North America is almost empty, especially the frozen far north. Population densities are highest in the highlands of Mexico and Central America; the coastal plain stretching from the Gulf of Mexico along the Atlantic coast; the Great Lakes area; and the Pacific coast. Large conurbations have developed, notably the San-San (San Francisco–San Diego), Boswash (Boston–Washington) and Main Street (Toronto–Montréal). The populations of the Caribbean islands are small, but settlement is dense, due to the limited amount of land available.

Scale 1:30,750,000

(projection: Lambert Azimuthal Equal Area)

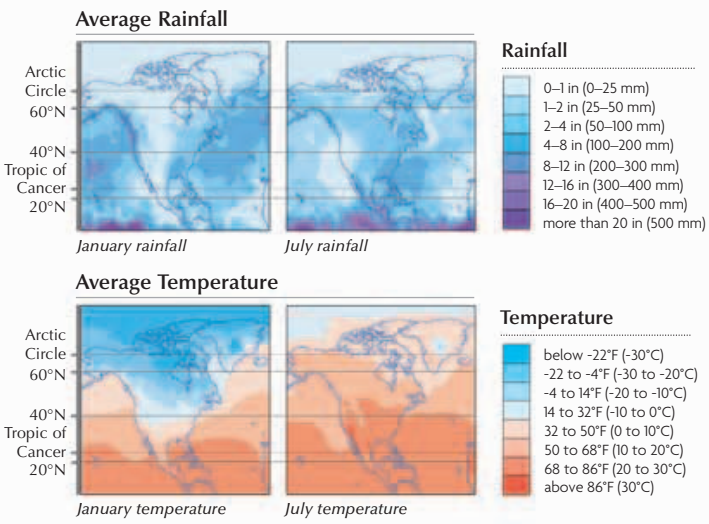
NORTH AMERICA – Physical

Environmental Issues

Many fragile environments are under threat throughout the region. In Haiti, all the primary rain forest has been destroyed, while air pollution from factories and cars in Mexico City is among the worst in the world. Elsewhere, industry and mining pose threats, particularly in the delicate arctic environment of Alaska where oil spills have polluted coastlines and decimated fish stocks.

Climate

North America's climate includes extremes ranging from freezing Arctic conditions in Alaska and Greenland, to desert in the southwest, and tropical conditions in southeastern Florida, the Caribbean, and Central America. Central and southern regions are prone to severe storms including tornadoes and hurricanes.



Land use

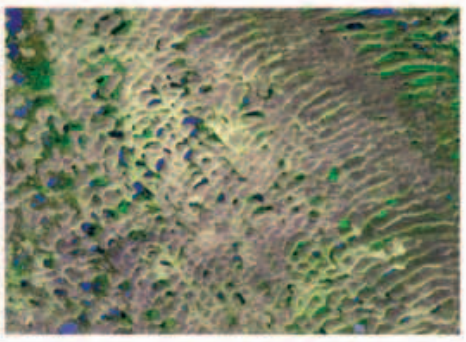
Abundant land and fertile soils stretch from the Canadian prairies to Texas creating North America's agricultural heartland. Cereals and cattle ranching form the basis of the farming economy, with corn and soybeans also important. Fruit and vegetables are grown in California using irrigation, while Florida is a leading producer of citrus fruits. Caribbean and Central American countries depend on cash crops such as bananas, coffee, and sugar cane, often grown on large plantations. This reliance on a single crop can leave these countries vulnerable to fluctuating world crop prices.

NORTH AMERICA

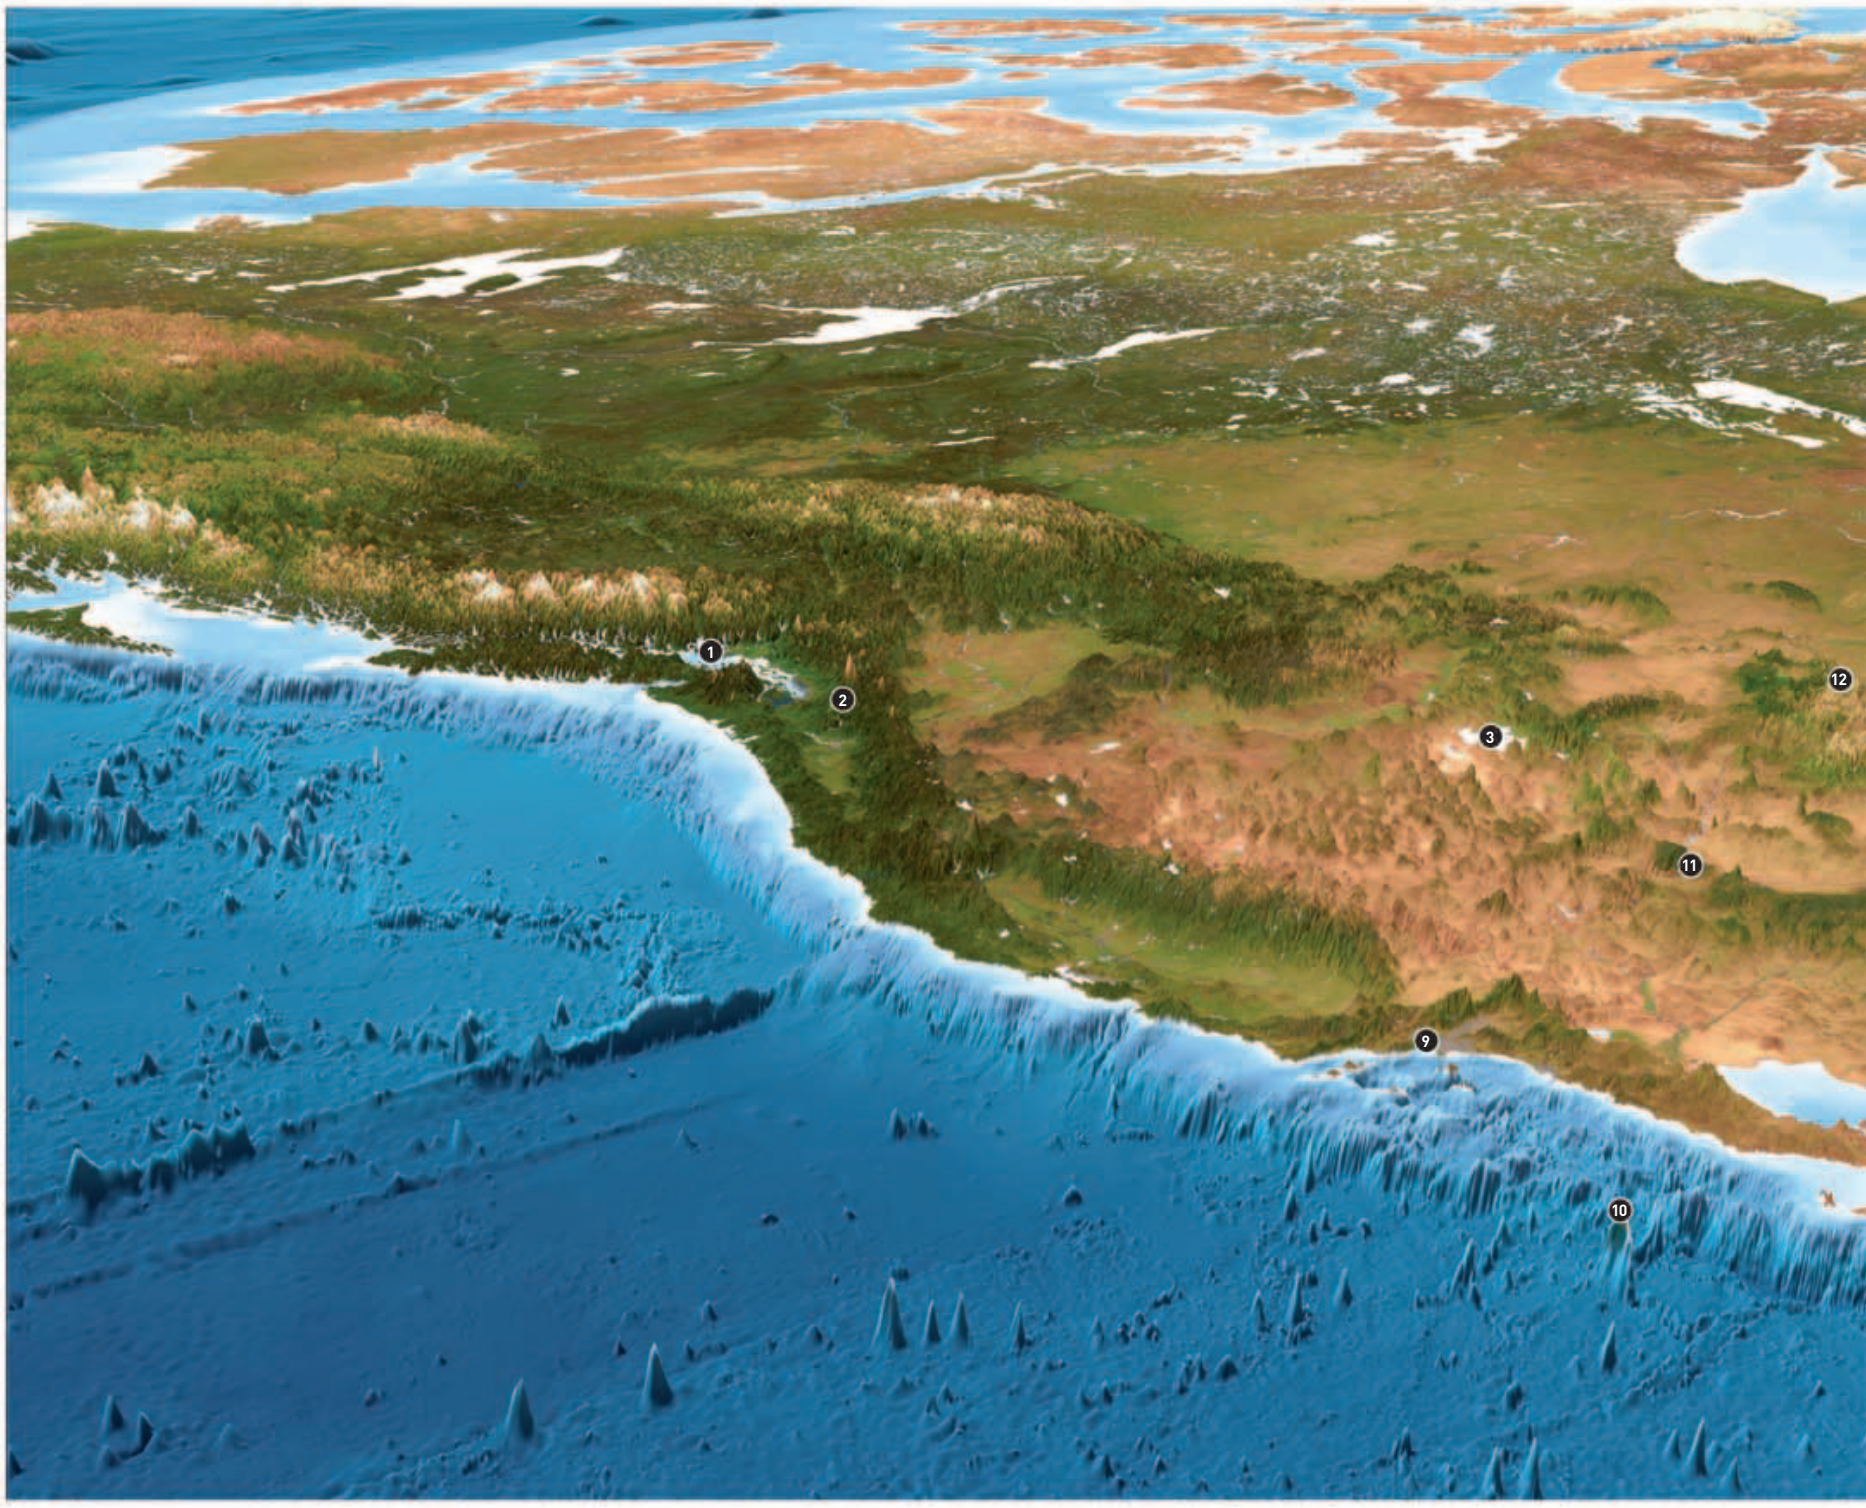
1 VANCOUVER, BRITISH COLUMBIA, CANADA
Canada's premier west coast city occupies the delta of the Fraser river, formed among the Coast Mountains.

2 MOUNT SAINT HELENS, WASHINGTON, USA
In 1980, this volcano's catastrophic eruption devastated 270 sq miles (700 sq km) of forest almost instantly.

3 GREAT SALT LAKE, UTAH, USA
A causeway carries a railroad, blocking circulation between the northern and southern parts, the water reddened by bacteria in the more saline north.



4 SAND HILLS, NEBRASKA, USA
Forming the largest sand sea in the Western Hemisphere, these hills are not classified as desert because today's relatively wet climate has allowed grasses to take hold.

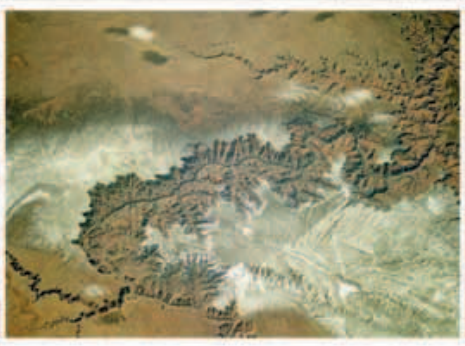


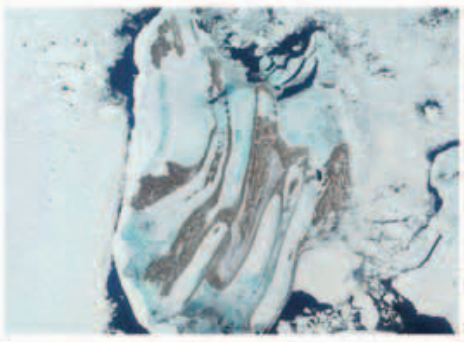
9 LOS ANGELES AND LONG BEACH, CALIFORNIA, USA
Taken together, these west coast cities constitute the busiest seaport in the United States.

10 ISLA GUADALUPE, MEXICO
The volcanic island, 186 miles (300 km) off the west coast of Mexico, is a protected wildlife reserve.

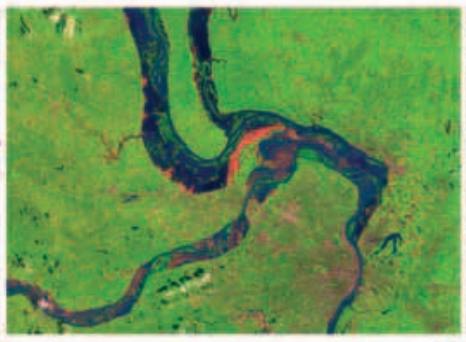
11 GRAND CANYON, ARIZONA, USA
The 5250 ft (1600 m) deep canyon cuts through the Kaibab Plateau in this southwest-looking view.

12 DENVER, COLORADO, USA
Colorado's state capital nestles under the Rocky Mountains with the South Platte River running through its center.

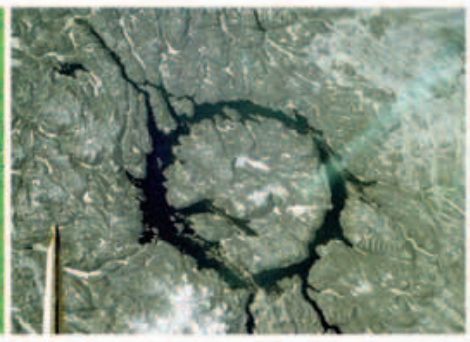




5 BELCHER ISLANDS, NUNAVUT, CANADA
These low-lying, treeless, and sparsely-populated islands lie icebound in Hudson Bay for much of the year.



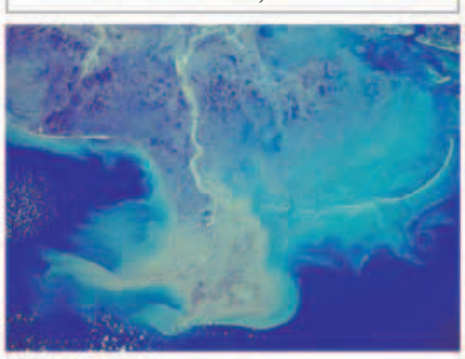
6 MISSISSIPPI, MISSOURI, AND ILLINOIS RIVERS, USA
This Infrared image shows how these rivers burst their banks in many places after heavy rains in the summer of 1993, leading to the area's worst floods on record.



7 RÉSERVOIR MANICOUAGAN, QUÉBEC, CANADA
This unusual 62 mile (100 km) diameter annular lake occupies the low ground between the rim and central uplift of an ancient meteorite crater.

8 NEW YORK CITY, USA
The largest city in the United States, with a population of over 8 million, it is also the country's main financial center.

13 MISSISSIPPI RIVER DELTA, LOUISIANA, USA
This delta has developed a "bird's foot'"shape due to the shifting course of the river over the last 6000 years.



14 FLORIDA, USA
This low-lying, subtropical peninsula is home to thousands of lakes that have formed among its limestone "karst" topography.

15 HAVANA, CUBA
Cuba's capital city is home to 2 million people and was founded by the Spanish in 1519 around a natural harbor.

16 BARRIER REEF, BELIZE
The world's second-longest barrier reef lies about 12 miles (20 km) off the coast of Belize.

SOUTH AMERICA

South America reaches from the humid tropics down into the cold South Atlantic, with a total area of 6,886,000 sq miles (17,835,000 sq km). It comprises 12 separate countries, with the largest, Brazil, covering almost half the continent.

FACTFILE

N **Most Northerly Point:** Punta Gallinas, Colombia 12° 28′ N
S **Most Southerly Point:** Cape Horn, Chile 55° 59′ S
E **Most Easterly Point:** Ilhas Martin Vaz, Brazil 28° 51′ W
W **Most Westerly Point:** Galapagos Islands, Ecuador 92° 00′ W

Largest Lakes:
1 Lake Titicaca, Bolivia/Peru 3141 sq miles (8135 sq km)
2 Mirim Lagoon, Brazil/Uruguay 1158 sq miles (3000 sq km)
3 Lago Poopó, Bolivia 976 sq miles (2530 sq km)
4 Lago Buenos Aires, Argentina/Chile 864 sq miles (2240 sq km)
5 Laguna Mar Chiquita, Argentina 695 sq miles (1800 sq km)

Longest Rivers:
1 Amazon, Brazil/Colombia/Peru 4049 miles (6516 km)
2 Paraná, Argentina/Brazil/Paraguay 2920 miles (4700 km)
3 Madeira, Bolivia/Brazil 2100 miles (3379 km)
4 Purus, Brazil/Peru 2013 miles (3239 km)
5 São Francisco, Brazil 1802 miles (2900 km)

Largest Islands:
1 Tierra del Fuego, Argentina/Chile 18,302 sq miles (47,401 sq km)
2 Ilha de Marajo, Brazil 15,483 sq miles (40,100 sq km)
3 Isla de Chiloé, Chile 3241 sq miles (8394 sq km)
4 East Falkland, Falkland Islands 2550 sq miles (6605 sq km)
5 Isla Wellington, Chile 2145 sq miles (5556 sq km)

Highest Points:
1 Cerro Aconcagua, Argentina 22,831 ft (6959 m)
2 Cerro Ojos del Salado, Argentina/Chile 22,572 ft (6880 m)
3 Cerro Bonete, Argentina 22,546 ft (6872 m)
4 Monte Pissis, Argentina 22,224 ft (6774 m)
5 Cerro Mercedario, Argentina 22,211 ft (6768 m)

Lowest Point:
▼ Península Valdés -131 ft (-40 m) below sea level

Highest recorded temperature:
+ Rivadavia, Argentina 120°F (49°C)

Lowest recorded temperature:
− Sarmiento, Argentina -27°F (-33°C)

Wettest Place:
≋ Quibdó, Colombia 354 in (8990 mm)

Driest Place:
– Arica, Chile 0.03 in (0.8 mm)

SOUTH AMERICA – Political

Political

Modern South America's political boundaries have their origins in the territorial endeavors of explorers during the 16th century, who claimed almost the entire continent for Portugal and Spain. The Portuguese land in the east later evolved into the federal states of Brazil, while the Spanish vice-royalties eventually emerged as separate independent nation-states in the early 19th century. South America's growing population has become increasingly urbanized, with the expansion of coastal cities into large conurbations like Rio de Janeiro and Buenos Aires. In Brazil, Argentina, Chile, and Uruguay, a succession of military dictatorships has given way to fragile, but strengthening, democracies.

Languages

Prior to European exploration in the 16th century, a diverse range of indigenous languages were spoken across the continent. With the arrival of Iberian settlers, Spanish became the dominant language, with Portuguese spoken in Brazil, and Native American languages, such as Quechua and Guaraní, becoming concentrated in the continental interior. Today this pattern persists, although successive European colonization has led to Dutch being spoken in Suriname, English in Guyana, and French in French Guiana, while in large urban areas, Japanese and Chinese are increasingly common.

Standard of living

Wealth disparities throughout the continent create a wide gulf between affluent landowners and those afflicted by chronic poverty in inner-city slums. The illicit production of cocaine, and the hugely influential drug barons who control its distribution, contribute to the violent disorder and corruption which affect northwestern South America, destabilizing local governments and economies.

Population

Almost half of South America's population lives in Brazil but, due to the large uninhabited expanses of the Amazon Basin, its overall population density is much lower than in other countries. During the 20th century the most important population trend was the movement from rural to urban areas, giving rise to great population concentrations in cities like São Paulo, Rio de Janeiro, Caracas, Lima, Bogotá, and Buenos Aires.

Transportation

Most major road and rail routes are confined to the coastal regions by the forbidding natural barriers of the Andes mountains and the Amazon Basin. Few major cross-continental routes exist, although Buenos Aires serves as a transport center for the main rail links to La Paz and Valparaíso, while the construction of the Trans-Amazon and Pan-American Highways have made direct road travel possible from Recife to Lima and from Puerto Montt up the coast into central America. A new waterway project is proposed to transform the Paraguay river into a major shipping route, although it involves considerable wetland destruction.

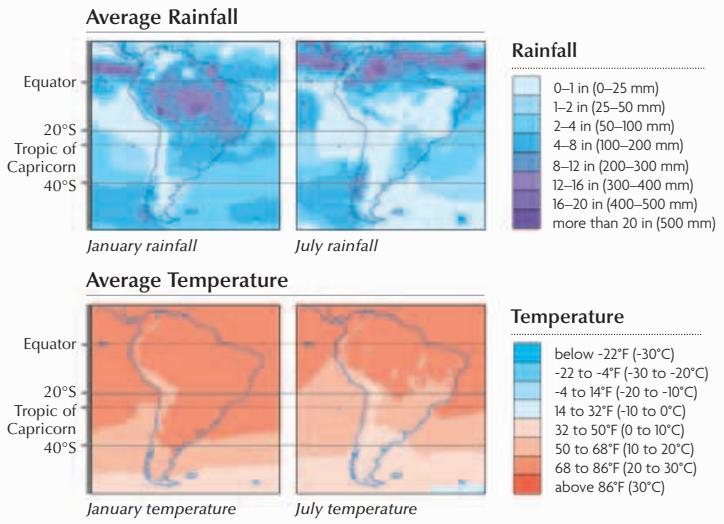
SOUTH AMERICA – Physical

Scale 1:29,000,000
(projection: Lambert Azimuthal Equal Area)

0 200 400 600 800 1000 Km
0 200 400 600 800 1000 Miles

Climate

The climate of South America is influenced by three principal factors: the seasonal shift of high pressure air masses over the tropics, cold ocean currents along the western coast, affecting temperature and precipitation, and the mountain barrier produced by by the Andes, which creates a rain shadow over much of the south.

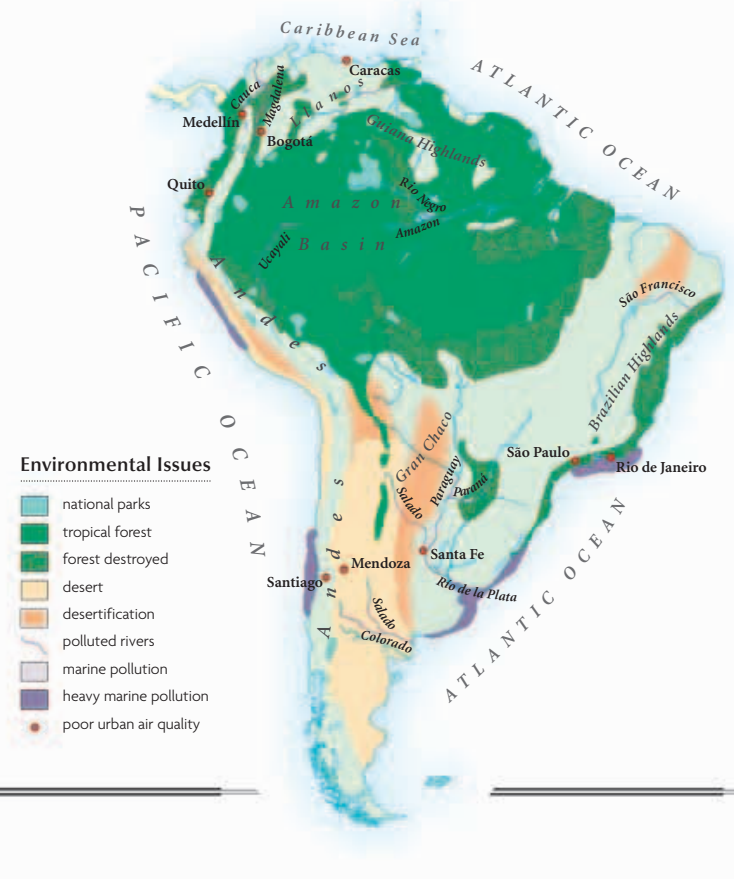


Land use

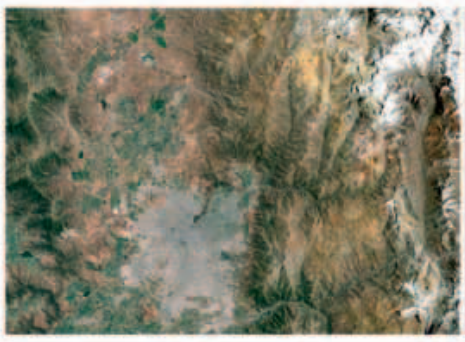
Many foods now common worldwide originated in South America. These include the potato, tomato, squash, and cassava. Today, large herds of beef cattle roam the temperate grasslands of the Pampas, supporting an extensive meat-packing trade in Argentina, Uruguay and Paraguay. Corn (maize) is grown as a staple crop across the continent and coffee is grown as a cash crop in Brazil and Colombia. Coca plants grown in Bolivia, Peru and Colombia provide most of the western world's cocaine. Fish and shellfish are caught off the western coast, especially anchovies off Peru, shrimps off Ecuador and sardines off Chile.

Environmental Issues

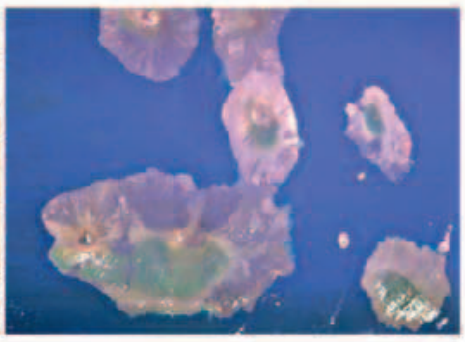
The Amazon Basin is one of the last great wilderness areas left on Earth. The tropical rainforests which grow there are a valuable genetic resource, containing innumerable unique plants and animals. The forests are increasingly under threat from new and expanding settlements and "slash and burn" farming techniques, which clear land for the raising of beef cattle, causing land degradation and soil erosion.



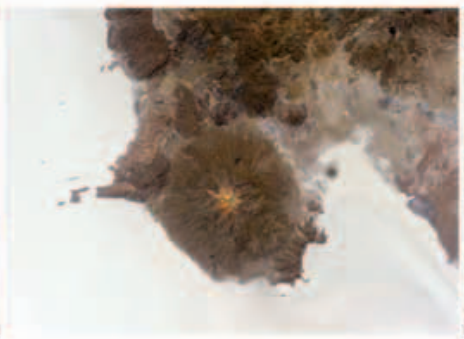
SOUTH AMERICA



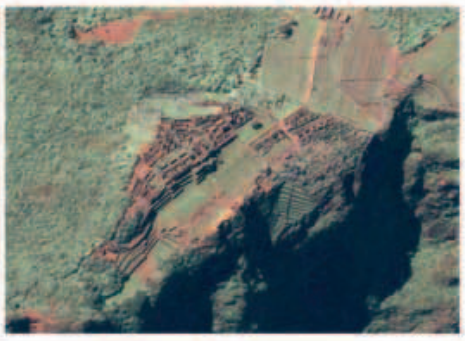
1 SANTIAGO, CHILE
Chile's capital city was founded in 1541 by Pedro de Valdivia who chose the location because it had a Mediterranean climate and was easy to defend.



2 GALAPAGOS ISLANDS, ECUADOR
These islands are a collection of volcanoes rising from the ocean floor 621 miles (1000 km) west of the South American mainland.



3 SALAR DE UYUNI, BOLIVIA
Occupying a depression high up on the Altiplano between the volcanoes of the western Andes and the fold belts of the eastern Andes, this is the world's largest salt flat.



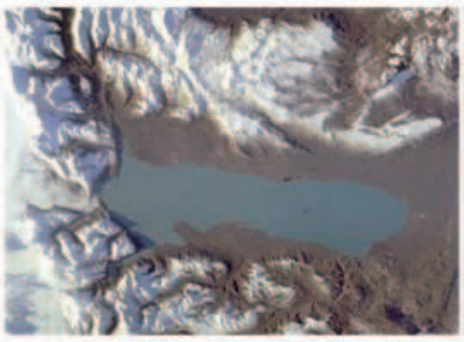
4 MACHU PICCHU, PERU
Perched precariously above the Urubamba valley, the lost Inca retreat was rediscovered in 1911 by Hiram Bingham, an American archaeologist.

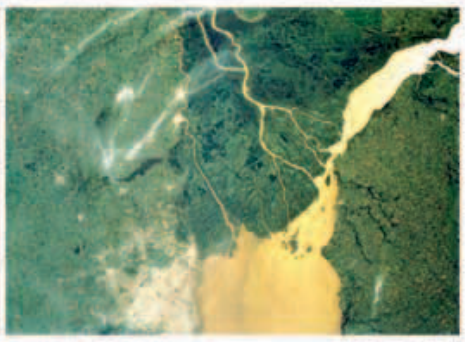
9 LAGO VIEDMA, ARGENTINA
Lago Viedma enjoys a milky-blue appearance due to the glacial sediment suspended in its waters.

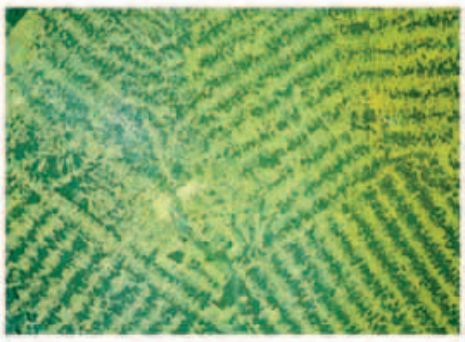
10 LOS LAGOS, CHILE
A region of many lakes at the foothills of the Andes in south-central Chile, this area is an attraction for many tourists.

11 ROSARIO, ARGENTINA
Located on the west bank of the Paraná river, Rosario lies at that heart of Argentina's industrial corridor, centered on the river.

12 RIVER PLATE, ARGENTINA/URUGUAY
Fed by the Paraná and Uruguay rivers, this Atlantic Ocean inlet separates Argentina and Uruguay.



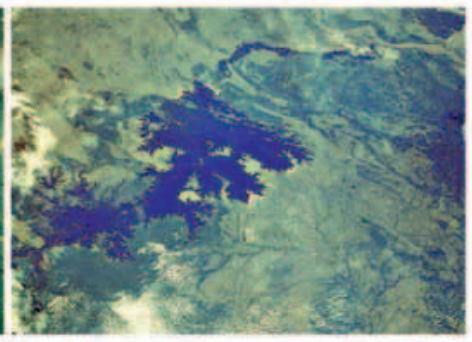




5 RONDÔNIA, BRAZIL
Pale strips of forest clearance can be seen along perpendicular tracks in this region of the Amazon Basin.

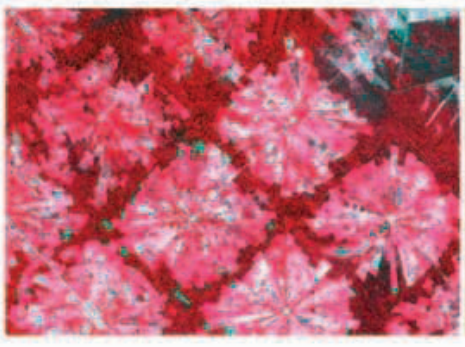
6 MARACAIBO, VENEZUELA
Maracaibo is the center of Venezuela's oil industry and its second largest city with a population of 1.6 million.

7 AMAZON RIVER/RIO NEGRO, BRAZIL
The dark, plant debris-stained waters of the Rio Negro join the beige Amazon near the city of Manaus.



8 EMBALSE DE GURI, VENEZUELA
This enormous reservoir, on the Caroni river, was completed in 1986 and its hydroelectric plant was the first to produce more than 10 gigawatts of electricity.

13 FOREST CLEARANCE IN SANTA CRUZ STATE, BOLIVIA
This infrared image shows the distinctive radial clearance patterns of original tropical dry forest with a small settlement at each center.



14 LAGOA DOS PATOS AND MIRIM LAGOON, BRAZIL/URUGUAY
These two lagoons are separated from the Atlantic Ocean by 248 miles (400 km) of sandbar.

15 ITAIPU DAM, BRAZIL/PARAGUAY
With an installed capacity of 14 gigawatts this is the world's largest hydroelectric power scheme, delivering 95% of Paraguay's energy needs and 24% of Brazil's.

16 POINT BALEIA, BRAZIL
This headland has built up through steady accumulation of silt and sediment, shaped by tides and ocean currents.

AFRICA

Africa is the world's second largest continent with a total area of 11,712,434 sq miles (30,335,000 sq km). It has 54 separate countries, including Madagascar in the Indian Ocean. It straddles the equator and is the only continent to stretch from the northern to southern temperate zones.

FACTFILE

- N **Most Northerly Point:** Jalta, Tunisia 37° 31' N
- S **Most Southerly Point:** Cape Agulhas, South Africa 34° 52' S
- E **Most Easterly Point:** Raas Xaafuun, Somalia 51° 24' E
- W **Most Westerly Point:** Santo Antão, Cape Verde, 25° 11' W

Largest Lakes:
1. Lake Victoria, Kenya/Tanzania/Uganda 26,828 sq miles (69,484 sq km)
2. Lake Tanganyika, Dem. Rep. Congo/Tanzania 12,703 sq miles (32,900 sq km)
3. Lake Nyasa, Malawi/Mozambique/Tanzania 11,600 sq miles (30,044 sq km)
4. Lake Turkana, Ethiopia/Kenya 2473 sq miles (6405 sq km)
5. Lake Albert, Dem. Rep. Congo/Uganda 2046 sq miles (5299 sq km)

Longest Rivers:
1. Nile, NE Africa 4160 miles (6695 km)
2. Congo, Angola/Congo/Dem. Rep. Congo 2900 miles (4667 km)
3. Niger, W Africa 2589 miles (4167 km)
4. Zambezi, Southern Africa 1673 miles (2693 km)
5. Ubangi-Uele, C Africa 1429 miles (2300 km)

Largest Islands:
1. Madagascar, 229,300 sq miles (594,000 sq km)
2. Réunion, 970 sq miles (2535 sq km)
3. Tenerife, Canary Islands 785 sq miles (2034 sq km)
4. Isla de Bioco, Equatorial Guinea 779 sq miles (2017 sq km)
5. Mauritius, 709 sq miles (1836 sq km)

Highest Points:
1. Kilimanjaro, Tanzania 19,340 ft (5895 m)
2. Kirinyaga, Kenya 17,058 ft (5199 m)
3. Mount Stanley, Dem. Rep. Congo/Uganda 16,762 ft (5109 m)
4. Mount Speke, Uganda 16,043 ft (4890 m)
5. Mount Baker, Uganda 15,892 ft (4844 m)

Lowest Point:
Lac 'Assal, Djibouti -512 ft (-156 m) below sea level

Highest recorded temperature:
Al'Aziziyah, Libya 136°F (58°C)

Lowest recorded temperature:
Ifrane, Morocco -11°F (-24°C)

Wettest Place:
Cape Debundsha, Cameroon 405 in (10,290 mm)

Driest Place:
Wadi Halfa, Sudan <0.1 in (<2.5 mm)

Political

The political map of modern Africa only emerged following the end of World War II. Over the next half-century, all of the countries formerly controlled by European powers gained independence from their colonial rulers—only Liberia and Ethiopia were never colonized. The post-colonial era has not been an easy period for many countries, but there have been moves toward multi-party democracy across much of the continent. In South Africa, democratic elections replaced the internationally-condemned apartheid system only in 1994. Other countries have still to find political stability; corruption in government and ethnic tensions are serious problems. National infrastructures, based on the colonial transportation systems built to exploit Africa's resources, are often inappropriate for independent economic development.

Standard of living

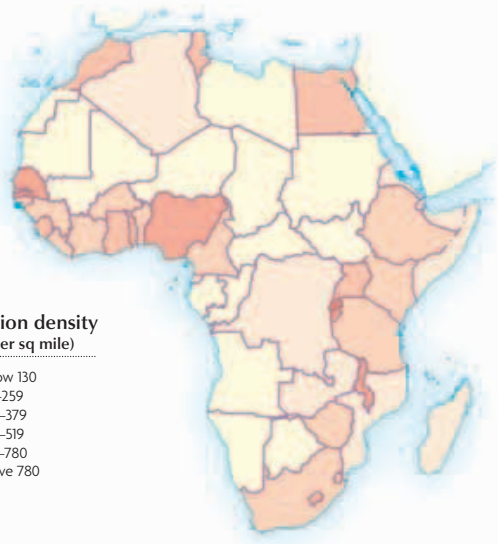
Since the 1960s most countries in Africa have seen significant improvements in life expectancy, healthcare, and education. However, 28 of the 30 most deprived countries in the world are African, and the continent as a whole lies well behind the rest of the world in terms of meeting many basic human needs.

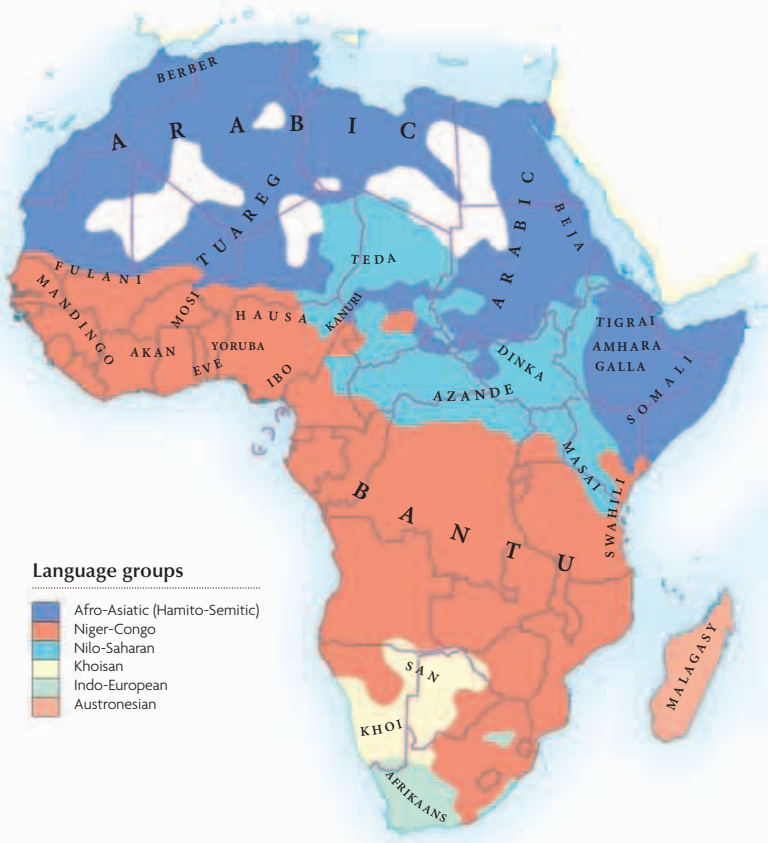
Transportation

African railroads were built to aid the exploitation of natural resources, and most offer passage only from the interior to the coastal cities, leaving large parts of the continent untouched—five land-locked countries have no railroads at all. The Congo, Nile, and Niger river networks offer limited access to land within the continental interior, but have a number of waterfalls and cataracts which prevent navigation from the sea. Many roads were developed in the 1960s and 1970s, but economic difficulties are making the maintenance and expansion of the networks difficult.

Population

Africa has a rapidly-growing population of over 900 million people, yet over 75% of the continent remains sparsely populated. Most Africans still pursue a traditional rural lifestyle, though urbanization is increasing as people move to the cities in search of employment. The greatest population densities occur where water is more readily available, such as in the Nile Valley, the coasts of North and West Africa, along the Niger, the eastern African highlands, and in South Africa.

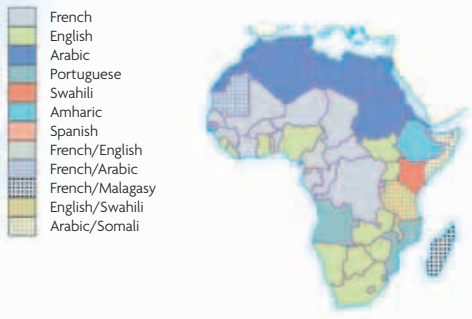




Languages

Three major world languages act as *lingua francas* across the African continent: Arabic in North Africa; English in southern and eastern Africa and Nigeria; and French in Central and West Africa, and in Madagascar. A huge number of African languages are spoken as well—over 2000 have been recorded, with more than 400 in Nigeria alone—reflecting the continuing importance of traditional cultures and values. In the north of the continent, the extensive use of Arabic reflects Middle Eastern influences while Bantu is widely-spoken across much of southern Africa.

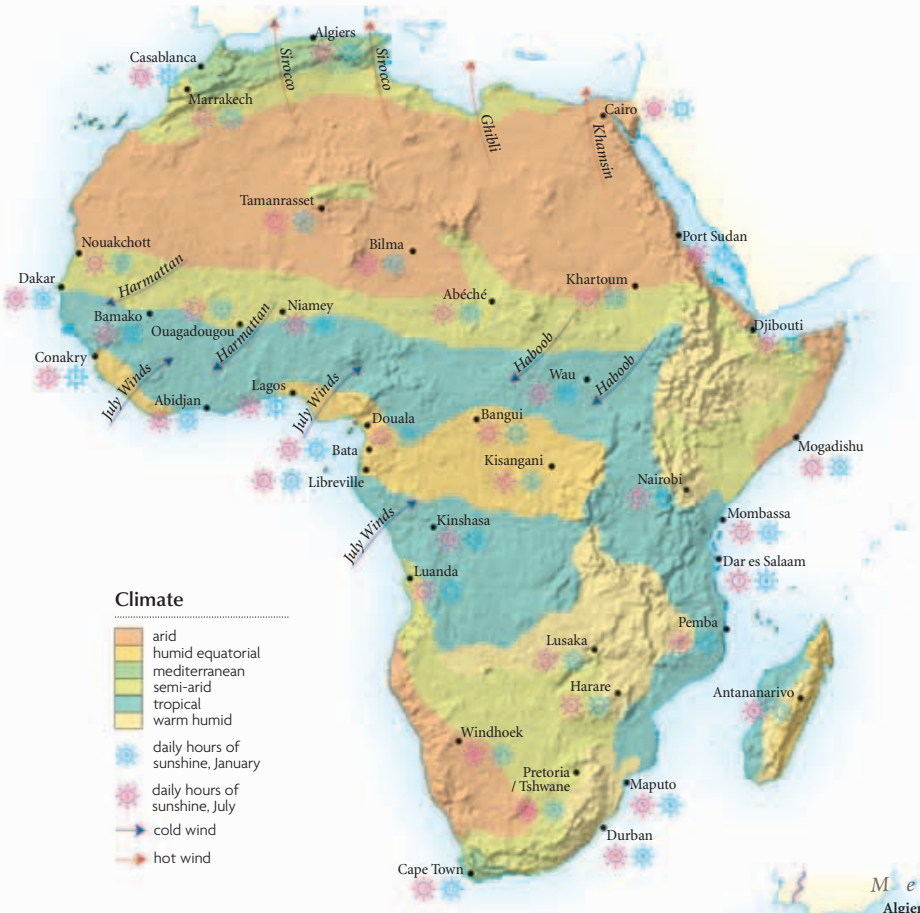
Official African Languages



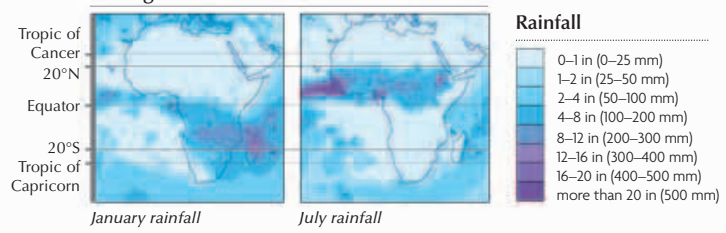
AFRICA – Physical

Climate

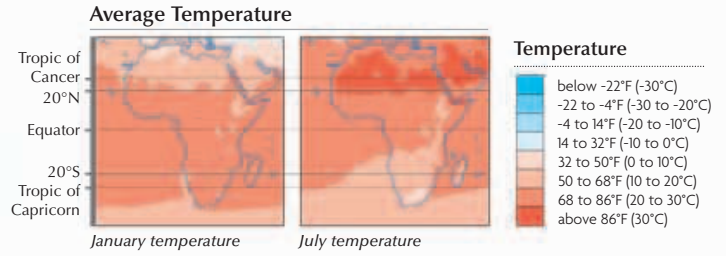
The climates of Africa range from mediterranean to arid, dry savannah and humid equatorial. In East Africa, where snow settles at the summit of volcanoes such as Kilimanjaro, climate is also modified by altitude. The winds of the Sahara export millions of tons of dust a year both northward and eastward.



Average Rainfall



Average Temperature

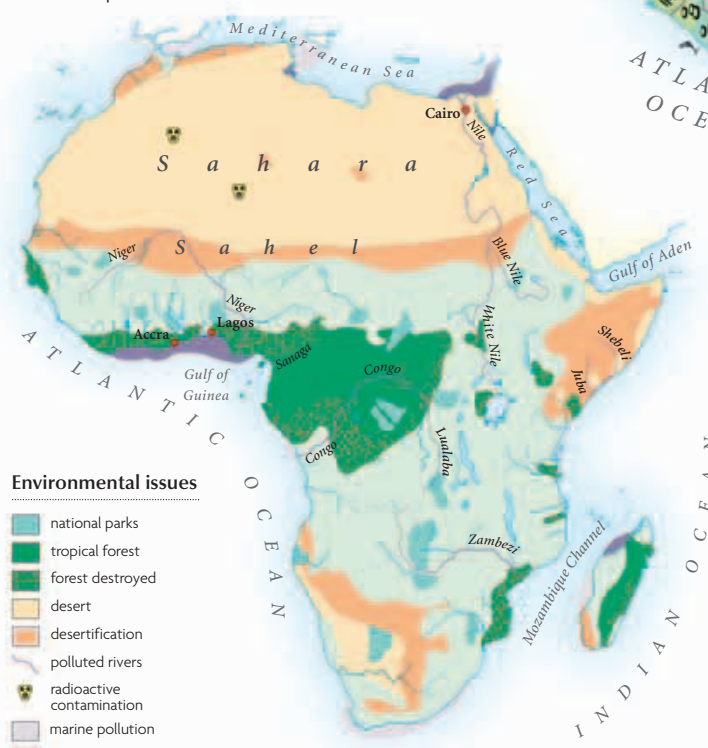


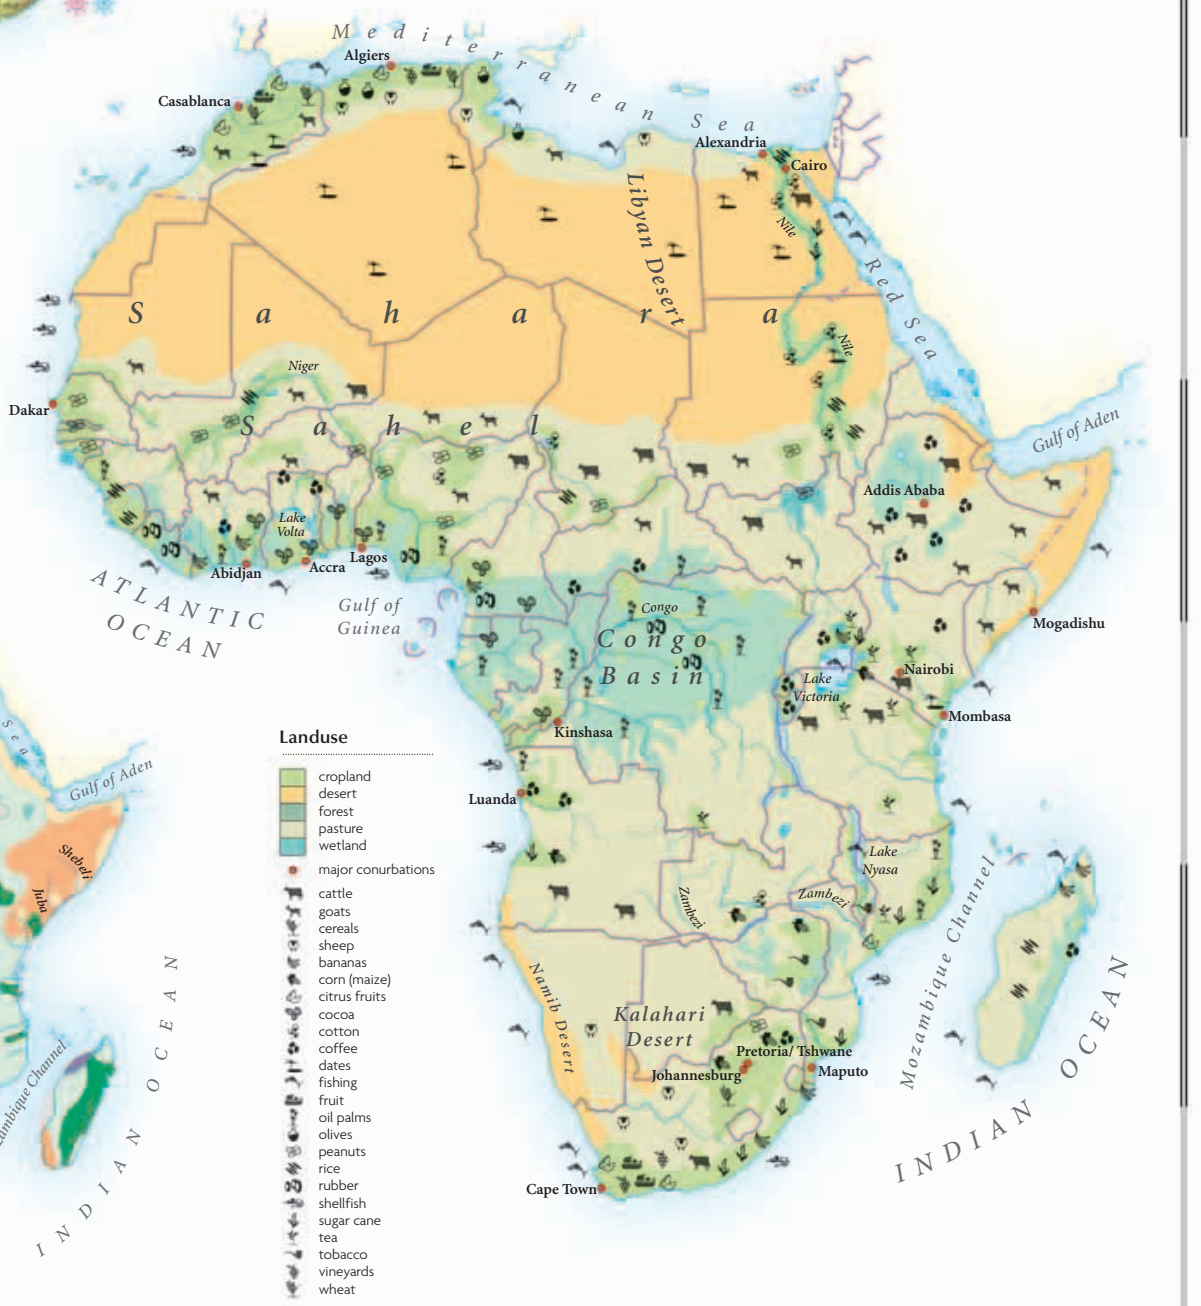
Land use

Some of Africa's most productive agricultural land is found in the eastern volcanic uplands, where fertile soils support a wide range of valuable export crops including vegetables, tea, and coffee. The most widely-grown grain is corn and peanuts (groundnuts) are particularly important in West Africa. Without intensive irrigation, cultivation is not possible in desert regions and unreliable rainfall in other areas limits crop production. Pastoral herding is most commonly found in these marginal lands. Substantial local fishing industries are found along coasts and in vast lakes such as Lake Nyasa and Lake Victoria.

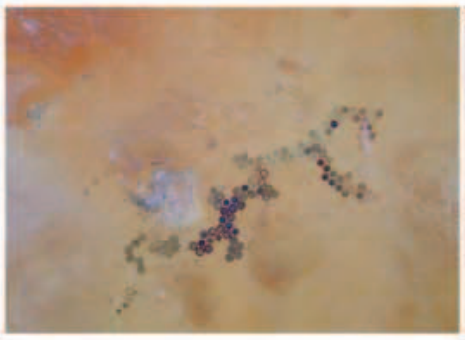
Environmental issues

One of Africa's most serious environmental problems occurs in marginal areas such as the Sahel where scrub and forest clearance, often for cooking fuel, combined with overgrazing, are causing desertification. Game reserves in southern and eastern Africa have helped to preserve many endangered animals, although the needs of growing populations have led to conflict over land use, and poaching is a serious problem.



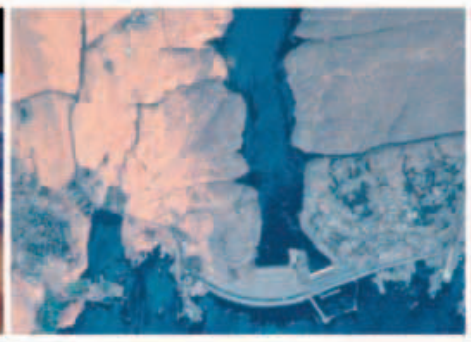


AFRICA



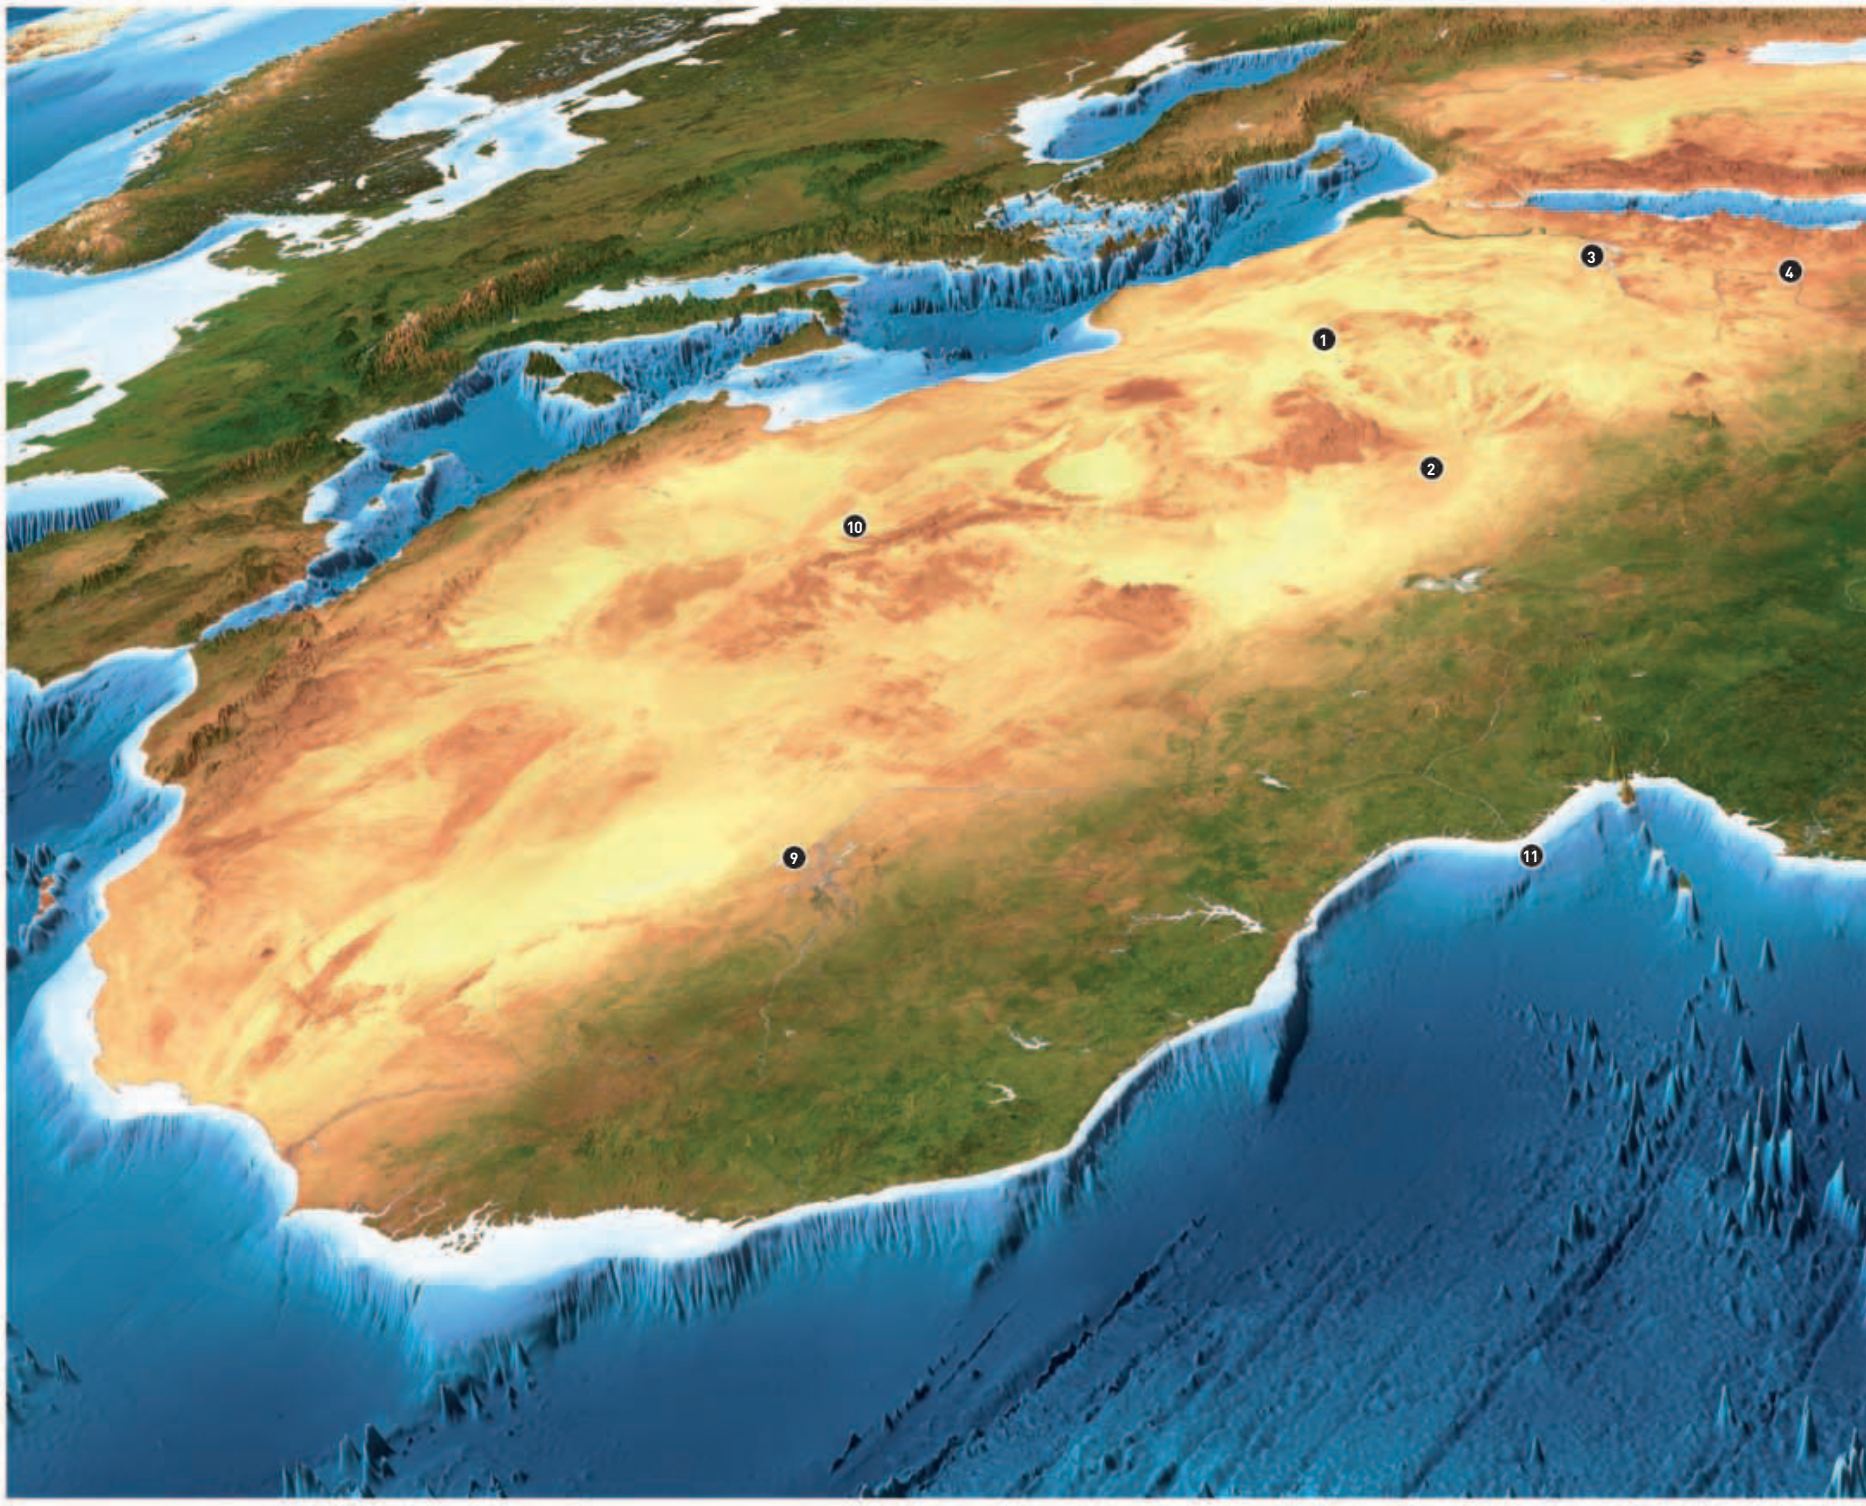
1 AL KHUFRAH, LIBYA
The circular irrigation patterns at this oasis have developed through the use of sprinkler units sweeping around a central point.

2 ERG DU DJOURAB, CHAD
Looking southwest, the pale area, just south of the darker Tibesti mountains on the right and the Ennedi plateau on the left, shows a desert sandstorm in motion.



3 ASWAN HIGH DAM, EGYPT
Completed in 1970 the dam controls flooding along the lower stretches of the Nile river.

4 KHARTOUM, SUDAN
The capital of Sudan lies at the junction of the Blue Nile, flowing from the east, and the broad White Nile, flowing from the south.

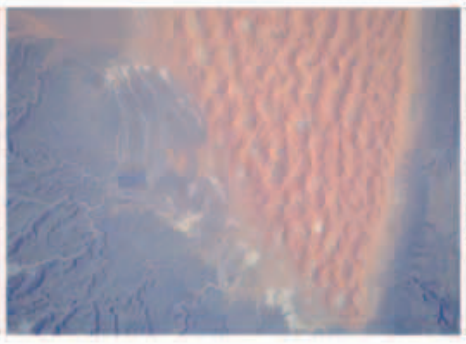


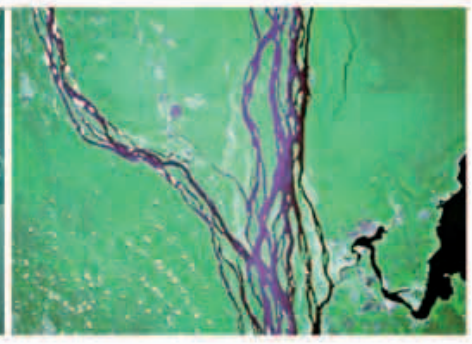
9 LAKE FAGUIBINE, MALI
Part of the Niger river's "inland delta," a region of lakes, creeks and backwaters near Tombouctou.

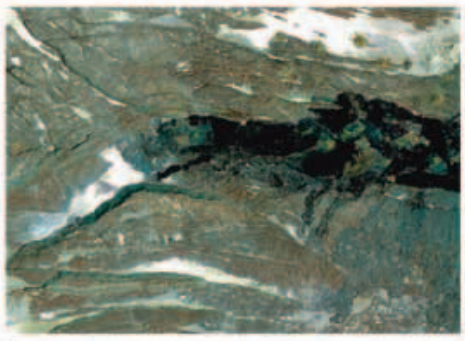
10 TASSILI-N-AJJER, ALGERIA
These sand dunes, one of a variety found in the Sahara, overlie the darker sandstone bedrock of the Tassili-n-Ajjer plateau.

11 NIGER DELTA, NIGERIA
At this point lies the vast, low-lying region through which the waters of the Niger river drain into the Gulf of Guinea.

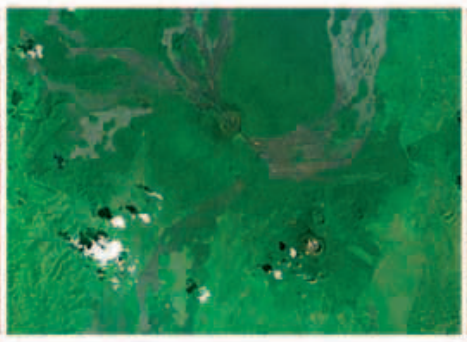
12 CONGO/UBANGI RIVERS, DR CONGO
The confluence of these two rivers lies at the heart of the Congo Basin.



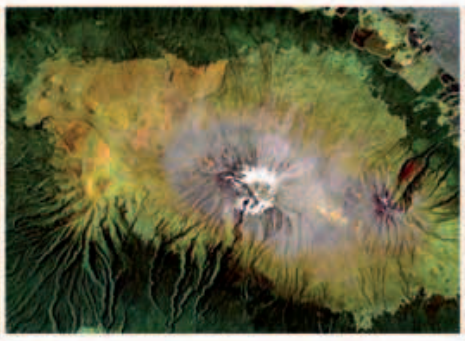




AFAR DEPRESSION, DJIBOUTI 5
This low point is located at the junction of three tectonic plates—the Gulf of Aden to the east, the Red Sea to the north and the Great Rift Valley to the south.



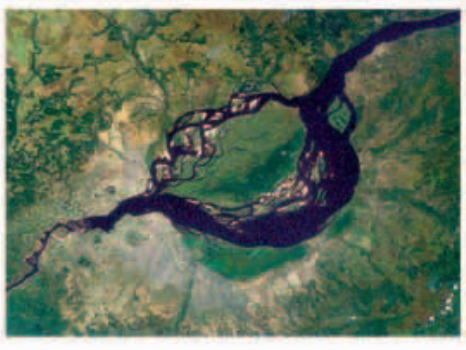
NYIRAGONGO AND NYAMURAGIRA VOLCANOES, DR CONGO 6
These two volcanoes, lying to the west of the Great Rift Valley, last erupted in 2002 and 2001 respectively.



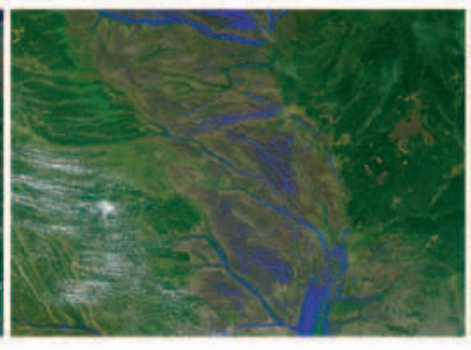
KILIMANJARO, TANZANIA 7
An extinct volcano, its great height modifies the local climate, forcing moist air streams from the Indian Ocean to rise, inducing rain and, higher up, snow.

BETSIBOKA RIVER, MADAGASCAR 8
The waters of Madagascar's second longest river are red with sediment as it carries eroded topsoil from the interior and deposits it in the Indian Ocean.

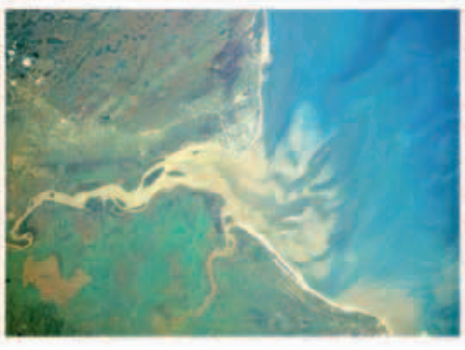
MALEBO POOL, CONGO/DR CONGO 13
A lake in the lower reaches of the Congo river, it hosts two capital cities on its banks, Brazzaville, Congo to the north and Kinshasa, DR Congo to the south.



ZAMBEZI RIVER, ZAMBIA 14
Seasonal flooding of the river and its tributaries turned the Mulonga and Liuwa plains on the Zambia-Angola border into a vast wetland in April 2004



BEIRA, MOZAMBIQUE 15
This port and beach resort lies on the north side of the mouth of the Pungoé river.



CAPE TOWN, SOUTH AFRICA 16
South Africa's third largest city with a population of 2.9 million, it is also the seat of the country's parliament.

Europe is the world's second smallest continent with a total area of 4,053,309 sq miles (10,498,000 sq km). It comprises 46 separate countries, including Turkey and the Russian Federation, although the greater parts of these nations lie in Asia.

FACTFILE

N **Most Northerly Point:** Ostrov Rudol'fa, Russian Federation 81° 47' N
S **Most Southerly Point:** Gávdos, Greece 34° 51' N
E **Most Easterly Point:** Mys Flissingskiy, Novaya Zemlya, Russian Federation 69° 03' E
W **Most Westerly Point:** Bjargtangar, Iceland 24° 33' W

Largest Lakes:
1. Lake Ladoga, Russian Federation 7100 sq miles (18,390 sq km)
2. Lake Onega, Russian Federation 3819 sq miles (9891 sq km)
3. Vänern, Sweden 2141 sq miles (5545 sq km)
4. Lake Peipus, Estonia/Russian Federation 1372 sq miles (3555 sq km)
5. Vättern, Sweden 737 sq miles (1910 sq km)

Longest Rivers:
1. Volga, Russian Federation 2265 miles (3645 km)
2. Danube, C Europe 1771 miles (2850 km)
3. Dnieper, Belarus/Russian Federation/Ukraine 1421 miles (2287 km)
4. Don, Russian Federation 1162 miles (1870 km)
5. Pechora, Russian Federation 1124 miles (1809 km)

Largest Islands:
1. Britain, 88,700 sq miles (229,800 sq km)
2. Iceland, 39,315 sq miles (101,826 sq km)
3. Ireland, 31,521 sq miles (81,638 sq km)
4. Ostrov Severny, Novaya Zemlya, Russian Federation 18,177 sq miles (47,079 sq km)
5. Spitsbergen, Svalbard 15,051 sq miles (38,981 sq km)

Highest Points:
1. El'brus, Russian Federation 18,510 ft (5642 m)
2. Dykhtau, Russian Federation 17,077 ft (5205 m)
3. Koshtantau, Russian Federation 16,877 ft (5144 m)
4. Gora Kazbek, Georgia/Russian Federation 16,647 ft (5074 m)
5. Gora Dzhangitau, Georgia/Russian Federation 16,571 ft (5051 m)

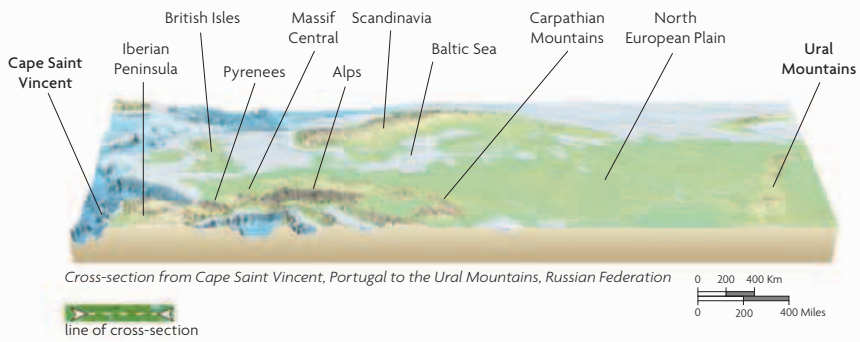
Lowest Point:
Caspian Depression, Russian Federation -92 ft (-28 m) below sea level

Highest recorded temperature:
Seville, Spain 122°F (50°C)

Lowest recorded temperature:
Ust'-Shchuger, Russian Federation -72.6°F (-58.1°C)

Wettest Place:
Crkvice, Bosnia and Herzegovina 183 in (4648 mm)

Driest Place:
Astrakhan', Russian Federation 6.4 in (162.5 mm)



Cross-section from Cape Saint Vincent, Portugal to the Ural Mountains, Russian Federation

Political

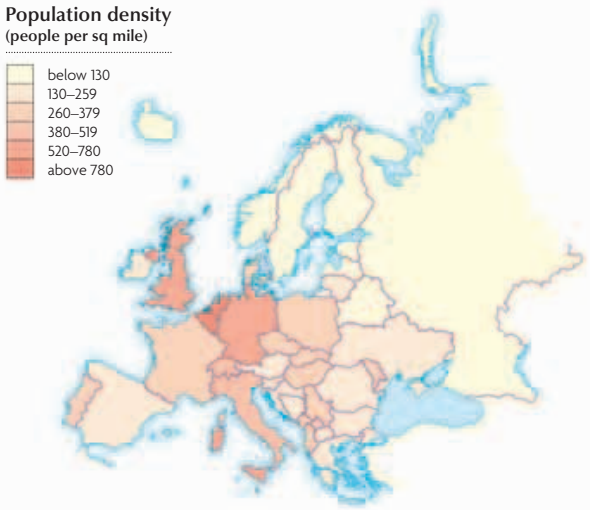
The political boundaries of Europe have changed many times, especially during the 20th century in the aftermath of two world wars, the break-up of the empires of Austria-Hungary, Nazi Germany, and, toward the end of the century, the collapse of communism in eastern Europe. The fragmentation of Yugoslavia has again altered the political map of Europe, highlighting a trend towards nationalism and devolution. In contrast, economic federalism is growing. In 1958, the formation of the European Economic Community (now the European Union or EU) started a move toward economic and political union and increasing internal migration. This process is still ongoing and the accession of Bulgaria and Romania in January 2007 brought the number of EU member states to twenty seven. Of these, seventeen have joined the Eurozone by adopting the Euro as their official currency.

Languages

There are three main European language groups: Germanic languages predominate in central and northern Europe; Romance languages in western and Mediterranean Europe and Romania; while Slavic languages are spoken in eastern Europe and the Russian Federation. Isolated pockets of local languages, such as Basque and Gaelic, persist and frequently provide a focus for national identity.

Population

Europe is a densely populated, urbanized continent; in Belgium over 90% of people live in urban areas. The highest population densities are found in an area stretching east from southern Britain and northern France, into Germany. The northern fringes are only sparsely populated.

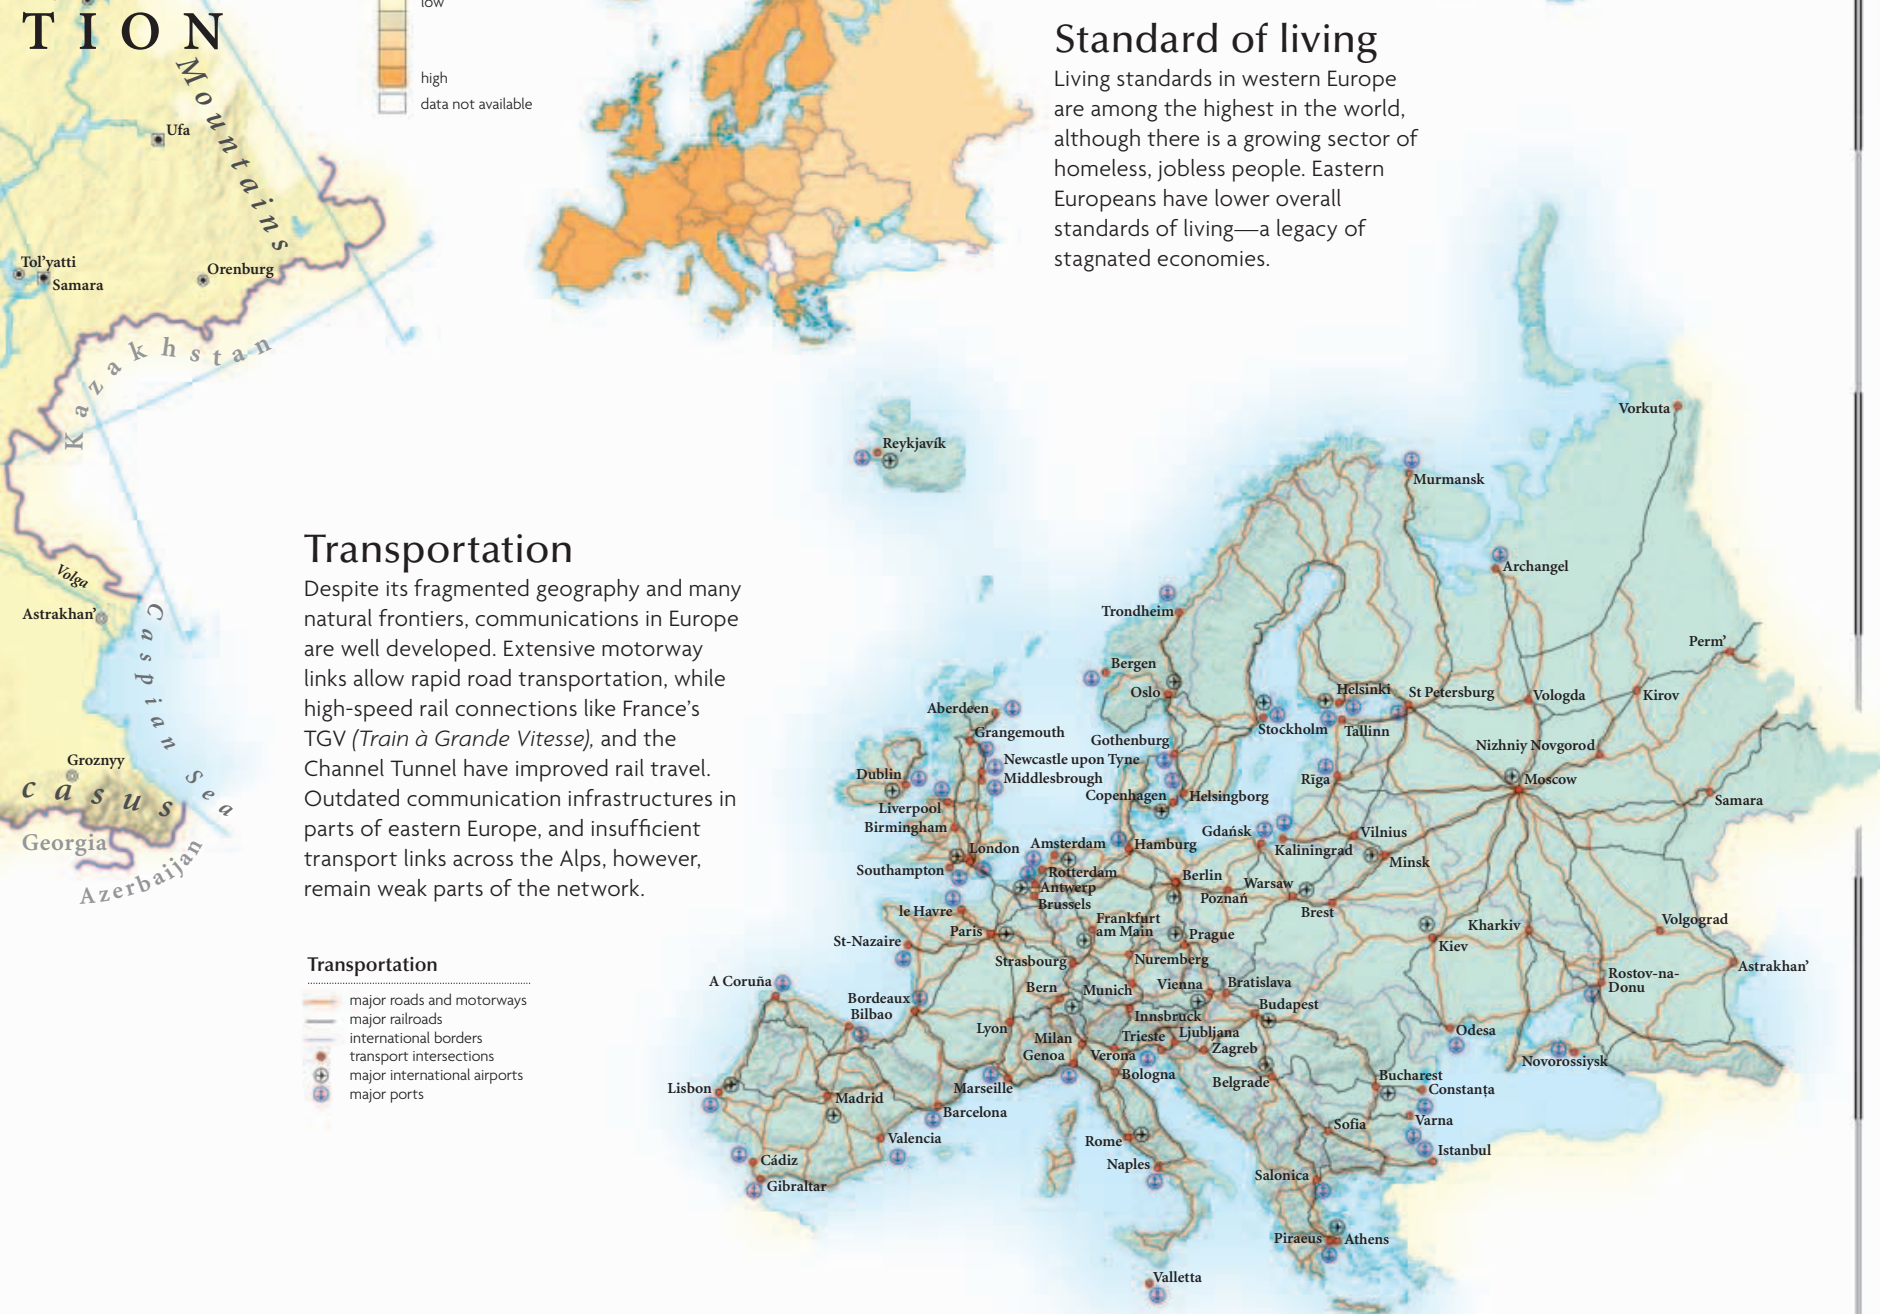


Standard of living

Living standards in western Europe are among the highest in the world, although there is a growing sector of homeless, jobless people. Eastern Europeans have lower overall standards of living—a legacy of stagnated economies.

Transportation

Despite its fragmented geography and many natural frontiers, communications in Europe are well developed. Extensive motorway links allow rapid road transportation, while high-speed rail connections like France's TGV *(Train à Grande Vitesse),* and the Channel Tunnel have improved rail travel. Outdated communication infrastructures in parts of eastern Europe, and insufficient transport links across the Alps, however, remain weak parts of the network.



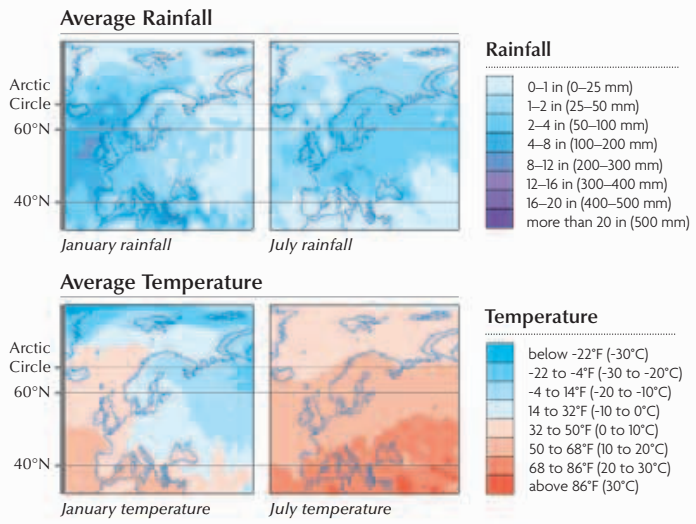
EUROPE – Physical

Scale 1:22,500,000
(projection: Lambert Conformal Conic)

0 200 400 600 800 1000 Km
0 200 400 600 800 1000 Miles

Climate

Europe experiences few extremes in either rainfall or temperature, with the exception of the far north and south. Along the west coast, the warm currents of the North Atlantic Drift moderate temperatures. Although east–west air movement is relatively unimpeded by relief, the Alpine Uplands halt the progress of north–south air masses, protecting most of the Mediterranean from cold, north winds.

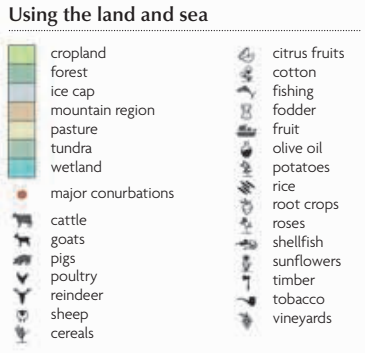


Environmental issues

The partially enclosed waters of the Baltic and Mediterranean seas have become heavily polluted, while the Barents Sea is contaminated with spent nuclear fuel from Russia's navy. Acid rain, caused by emissions from factories and power stations, is actively destroying northern forests. As a result, pressure is growing to safeguard Europe's natural environment and prevent further deterioration.

Land use

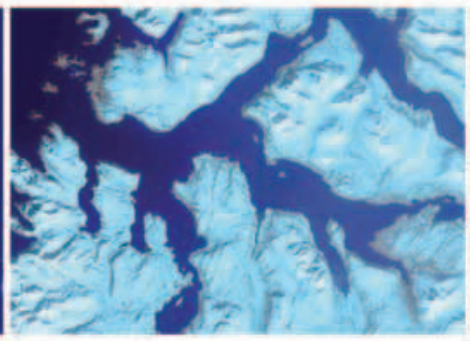
Europe's swelling urban population and the outward expansion of many cities has created acute competition for land. Despite this, European resourcefulness has maximized land potential, and over half of Europe's land is still used for a wide variety of agricultural purposes. Land in northern Europe is used for cattle-rearing, pasture, and arable crops. Towards the Mediterranean, the mild climate allows the growing of grapes for wine; olives, sunflowers, tobacco and citrus fruits. EU subsidies, however, have resulted in massive overproduction and a land "set-aside" policy has been introduced.



EUROPE

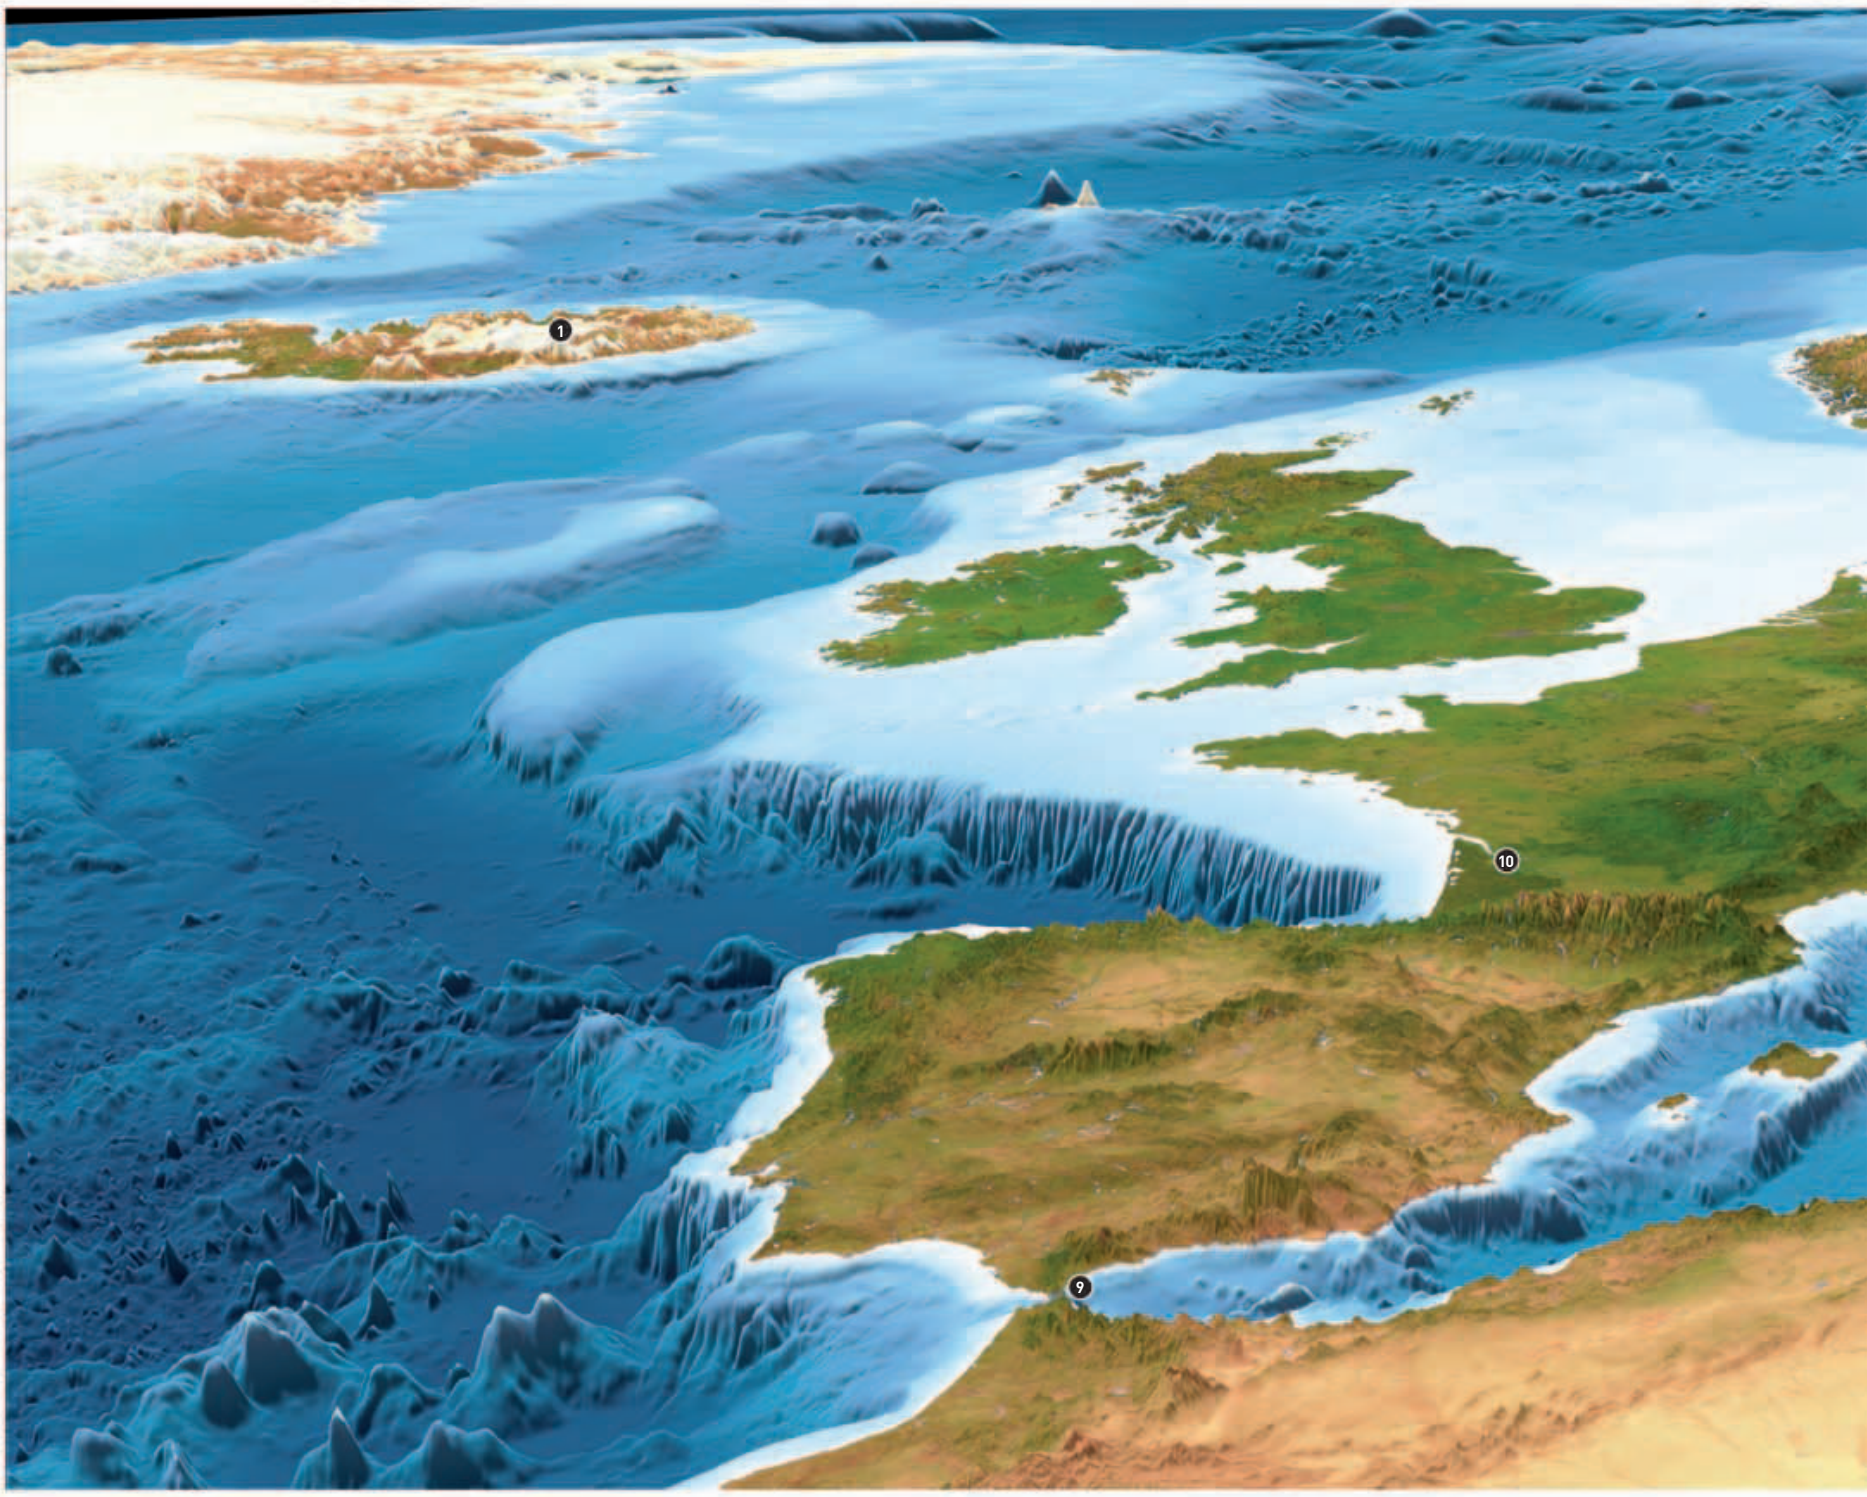
1 VATNAJÖKULL, ICELAND
Europe's largest ice cap is located in the southeast of this Atlantic island.

2 ORESUND LINK, DENMARK/SWEDEN
This link was opened to traffic in 2000, joining the Danish capital, Copenhagen, with the Swedish town of Malmö across the waters of the Oresund Strait.



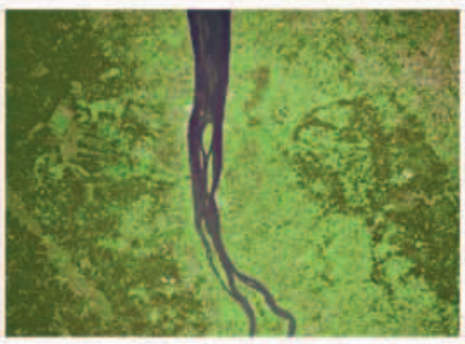
3 BALSFJORD, NORWAY
Fjords were cut into Norway's west coast by glaciers during the last ice age but as the ice retreated rising sea-levels flooded the valleys left behind.

4 PRAGUE, CZECH REPUBLIC
In August 2002 some parts of the capital were still under water after the worst floods in living memory.



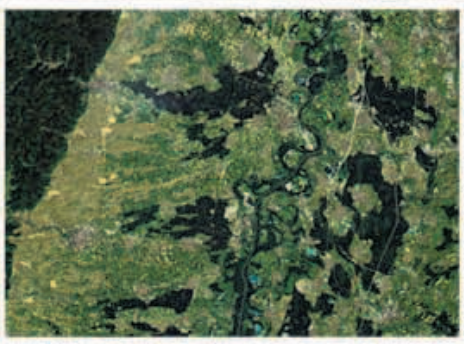
9 GIBRALTAR
A British colony since 1713, this rocky promontory commands a strategic position at the southern end of the Iberian Peninsula.

10 BORDEAUX, FRANCE
Famous for its wines, this city sits on the west bank of the Garonne river, which is joined from the east by the Dordogne river.



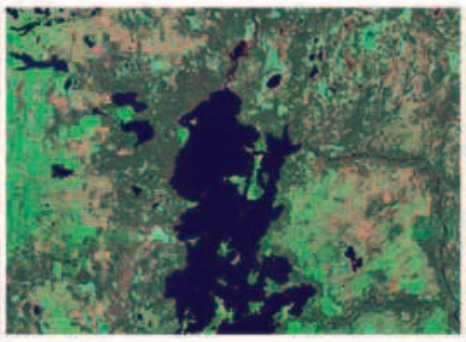
11 SOUTH FLEVOLAND, NETHERLANDS
This polder was reclaimed from the sea in the early 1970s and is now home to extensive farmland and small towns.

12 RHINE, GERMANY
The Rhine has been straightened in places, such as here, just south of Mannheim, to ease navigation.



5 HEL PENINSULA, POLAND
The long spit of this peninsula encloses Puck Bay and shelters the important port of Gdynia.

6 TALLINN, ESTONIA
The capital and main port of Estonia has become a popular tourist destination in recent years.



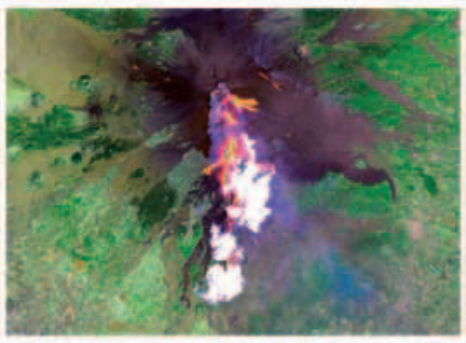
7 LAKE VODLOZERO, RUSSIAN FEDERATION
The lake lies within a national park, which protects one of the most untouched wilderness areas in Europe and encompasses plains, taiga forests, and wetlands.

8 DANUBE DELTA, ROMANIA
The Danube river splits into several channels as it flows into the Black Sea, forming one of Europe's most important wetland ecosystems.

13 VENICE, ITALY
Occupying the largest island in a sheltered lagoon at the north end of the Adriatic, this city was founded in 452 CE and grew rich on an extensive trading network.

14 ISTRA PENINSULA, CROATIA
This triangular peninsula marks the northern extent of Croatia's Dalmatian coastline.

15 MOUNT ETNA, SICILY, ITALY
This combination of visible and thermal images shows the volcano erupting in July 2001 and clearly indicates the major lava flows.



16 KEFALLONIÁ, GREECE
The largest of the Ionian Islands off Greece's west coast, Kefalloniá is mountainous with relatively high rainfall.

ASIA

Asia is the world's largest continent with a total area of 16,838,365 sq miles (43,608,000 sq km). It comprises 49 separate countries, including 97% of Turkey and 72% of the Russian Federation. Almost 60% of the world's population lives in Asia.

FACTFILE

N Most Northerly Point: Mys Articheskiy, Russia 81° 12' N
S Most Southerly Point: Pulau Pamana, Indonesia 11° S
E Most Easterly Point: Mys Dezhneva, Russia 169° 40' W
W Most Westerly Point: Bozzcaada, Turkey 26° 2' E

Largest Lakes:
1 Caspian Sea, Asia/Europe 143,243 sq miles (371,000 sq km)
2 Lake Baikal, Russian Federation 11,776 sq miles (30,500 sq km)
3 Lake Balkhash, Kazakhstan/China 7115 sq miles (18,428 sq km)
4 Aral Sea, Kazakhstan/Uzbekistan 6625 sq miles (17,160 sq km)
5 Tonlé Sap, Cambodia 3861 sq miles (10,000 sq km)

Longest Rivers:
1 Yangtze, China 3915 miles (6299 km)
2 Yellow River, China 3395 miles (5464 km)
3 Mekong, SE Asia 2749 miles (4425 km)
4 Lena, Russian Federation 2734 miles (4400 km)
5 Yenisey, Russian Federation 2541 miles (4090 km)

Largest Islands:
1 Borneo, Brunie/Indonesia/Malaysia 292,222 sq miles (757,050 sq km)
2 Sumatra, Indonesia 202,300 sq miles (524,000 sq km)
3 Honshu, Japan 88,800 sq miles (230,000 sq km)
4 Sulawesi, Indonesia 73,057 sq miles (189,218 sq km)
5 Java, Indonesia 53,589 sq miles (138,794 sq km)

Highest Points:

Political

Asia is the world's largest continent, encompassing many different and discrete realms, from the desert Arab lands of the southwest to the subtropical archipelago of Indonesia; from the vast barren wastes of Siberia to the fertile river valleys of China and South Asia, seats of some of the world's most ancient civilizations. The collapse of the Soviet Union has fragmented the north of the continent into the Siberian portion of the Russian Federation, and the new republics of Central Asia. Strong religious traditions heavily influence the politics of South and Southwest Asia. Hindu and Muslim rivalries threaten to upset the political equilibrium in South Asia where India—in terms of population—remains the world's largest democracy. China, another population giant, is reasserting its position as a world political and economic power, while on its doorstep, the dynamic Pacific Rim countries, led by Japan, continue to assert their worldwide economic force.

Population

Some of the world's most populous and least populous regions are in Asia. The plains of eastern China, the Ganges River plains in India, Japan, and the Indonesian island of Java, all have very high population densities; by contrast parts of Siberia and the Plateau of Tibet are virtually uninhabited. China has the world's greatest population—20% of the globe's total—while India, with the second largest, has more than one billion.

Transportation

The transportation system varies enormously in extent and quality across Asia. Early trade routes included the Silk Route, from Beijing across Central Asia, and the sea routes around the coastline of southern Asia. Today, transportation networks often radiate from coastal ports, reflecting the continuing importance of sea and river travel for trade and external communications. In the interior, high mountain barriers such as the Himalayas, the Altai Mountains, and the Tien Shan, deserts like the Gobi, Takla Makan, and Ar Rub' al Khali, remain virtually impenetrable to most modern terrestrial transportation. Major engineering feats are necessary to conquer these hostile frontier territories, although the success of the Trans-Siberian Railway in overcoming the harsh Siberian landscape, proves that cross-continental transportation, if not economically viable, is physically possible.

Languages

During the 19th century, Russian was introduced into Central Asia and Siberia. Under the Soviets, Russian-speaking became mandatory—replacing the indigenous Ural-Altaic languages in many urban areas—although today the use of Central Asian languages is being revived in the new republics. India's linguistic mosaic comprises Dravidian languages, such as Tamil, in the south, and the Indo-Aryan languages of the north such as Hindi. In China, three main languages, Mandarin Chinese, Wu Chinese, and Cantonese, share the same written form but their spoken dialects are mutually unintelligible.

Standard of living

Despite Japan's high standards of living, and Southwest Asia's oil-derived wealth, immense disparities exist across the continent. Afghanistan remains one of the world's most underdeveloped nations, as do the mountain states of Nepal and Bhutan. Further rapid population growth is exacerbating poverty and overcrowding in many parts of India and Bangladesh.

Climate

The climate of Asia exhibits marked differences from region to region, with freezing polar conditions in the north, hot and cold deserts in central regions and subtropical conditions throughout the south. Much of this variation can be attributed to enormous mountain barriers and internal depressions found across the continent. Monsoon winds, which reverse semi-annually, cause alternate wet and dry seasons across southern Asia. These air masses moving north from the ocean are stripped of their moisture over the Himalayas causing arid conditions across the Plateau of Tibet. Both the south and east are susceptible to tropical cyclones or typhoons.

- 68 to 86°F (20 to 30°C)
- above 86°F (30°C)

Environmental issues

The transformation of Uzbekistan by the former Soviet Union into the world's fifth largest producer of cotton led to the diversion of several major rivers for irrigation. Starved of this water, the Aral Sea diminished in volume by over 75% since 1960, irreversibly altering the ecology of the area. Heavy industries in eastern China have polluted coastal waters, rivers and urban air, while in Myanmar (Burma), Malaysia and Indonesia, ancient hardwood rainforests are felled faster than they can regenerate.

Environmental issues

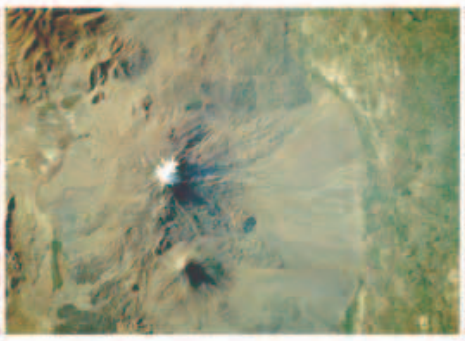
- tropical forest
- forest destroyed
- desert
- desertification
- acid rain
- polluted rivers
- marine pollution
- heavy marine pollution
- radioactive contamination
- poor urban air quality

Land use

Vast areas of Asia remain uncultivated as a result of unsuitable climatic and soil conditions. In favourable areas such as river deltas, farming is intensive. Rice is the staple crop of most Asian countries, grown in paddy fields on waterlogged alluvial plains and terraced hillsides, and often irrigated for higher yields. Across the black earth region of the Eurasian steppe in southern Siberia and Kazakhstan, wheat farming is the dominant activity. Cash crops, like tea in Sri Lanka and dates in the Arabian Peninsula, are grown for export, and provide valuable income. The sovereignty of the rich fishing grounds in the South China Sea is disputed by China, Malaysia, Taiwan, the Philippines and Vietnam, because of potential oil reserves.

ASIA

1 BOSPORUS, TURKEY
The Bosporus provides the only outlet for the Black Sea, linking it with the Sea of Marmara to the south and then with the Mediterranean Sea via the Dardanelles.



2 MOUNT ARARAT, TURKEY
Said to be the resting place for Noah's Ark, this extinct volcanic massif lies in the far east of Turkey.

3 LAKE BALKASH, KAZAKHSTAN
Still covered in winter ice in this image, this lakes lies in a dry desert region and has no outlet.

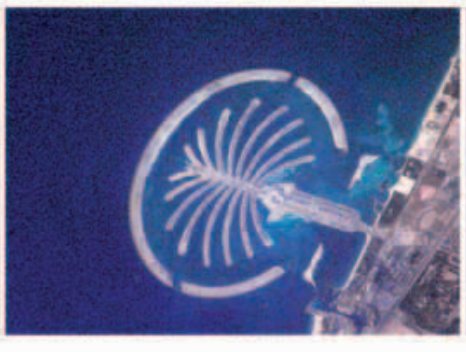
4 OZERO ISSYK-KUL', KYRGYZSTAN
Against the dry slopes of the Tien Shan mountains to the south this lake appears bright blue.

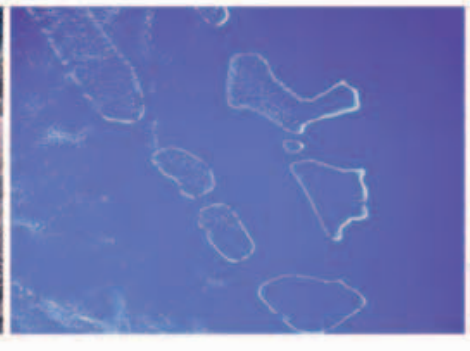
9 KUWAIT'S OILFIELDS, KUWAIT
The dark plumes are smoke rising from the 700 wells set alight by Iraqi forces during the Gulf War of 1991.

10 PALM ISLAND, UNITED ARAB EMIRATES
This luxury housing development and tourist resort, one mile (1.6 km) off the seafront of Dubai, is built from sediments dredged from the nearby port of Jebel Ali.

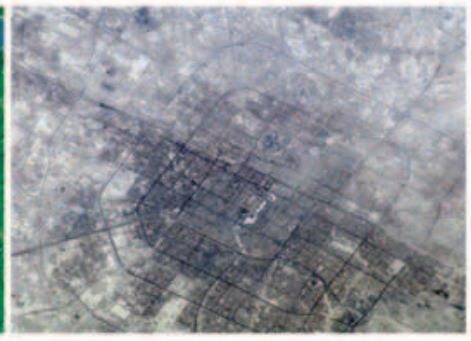
11 MALDIVES
The Maldives consist of 1300 coral formations in 19 atolls and stretch over 1491 miles (2400 km).

12 KARACHI, PAKISTAN
Pakistan's main seaport and former capital lies to the northwest of the delta of the Indus river.





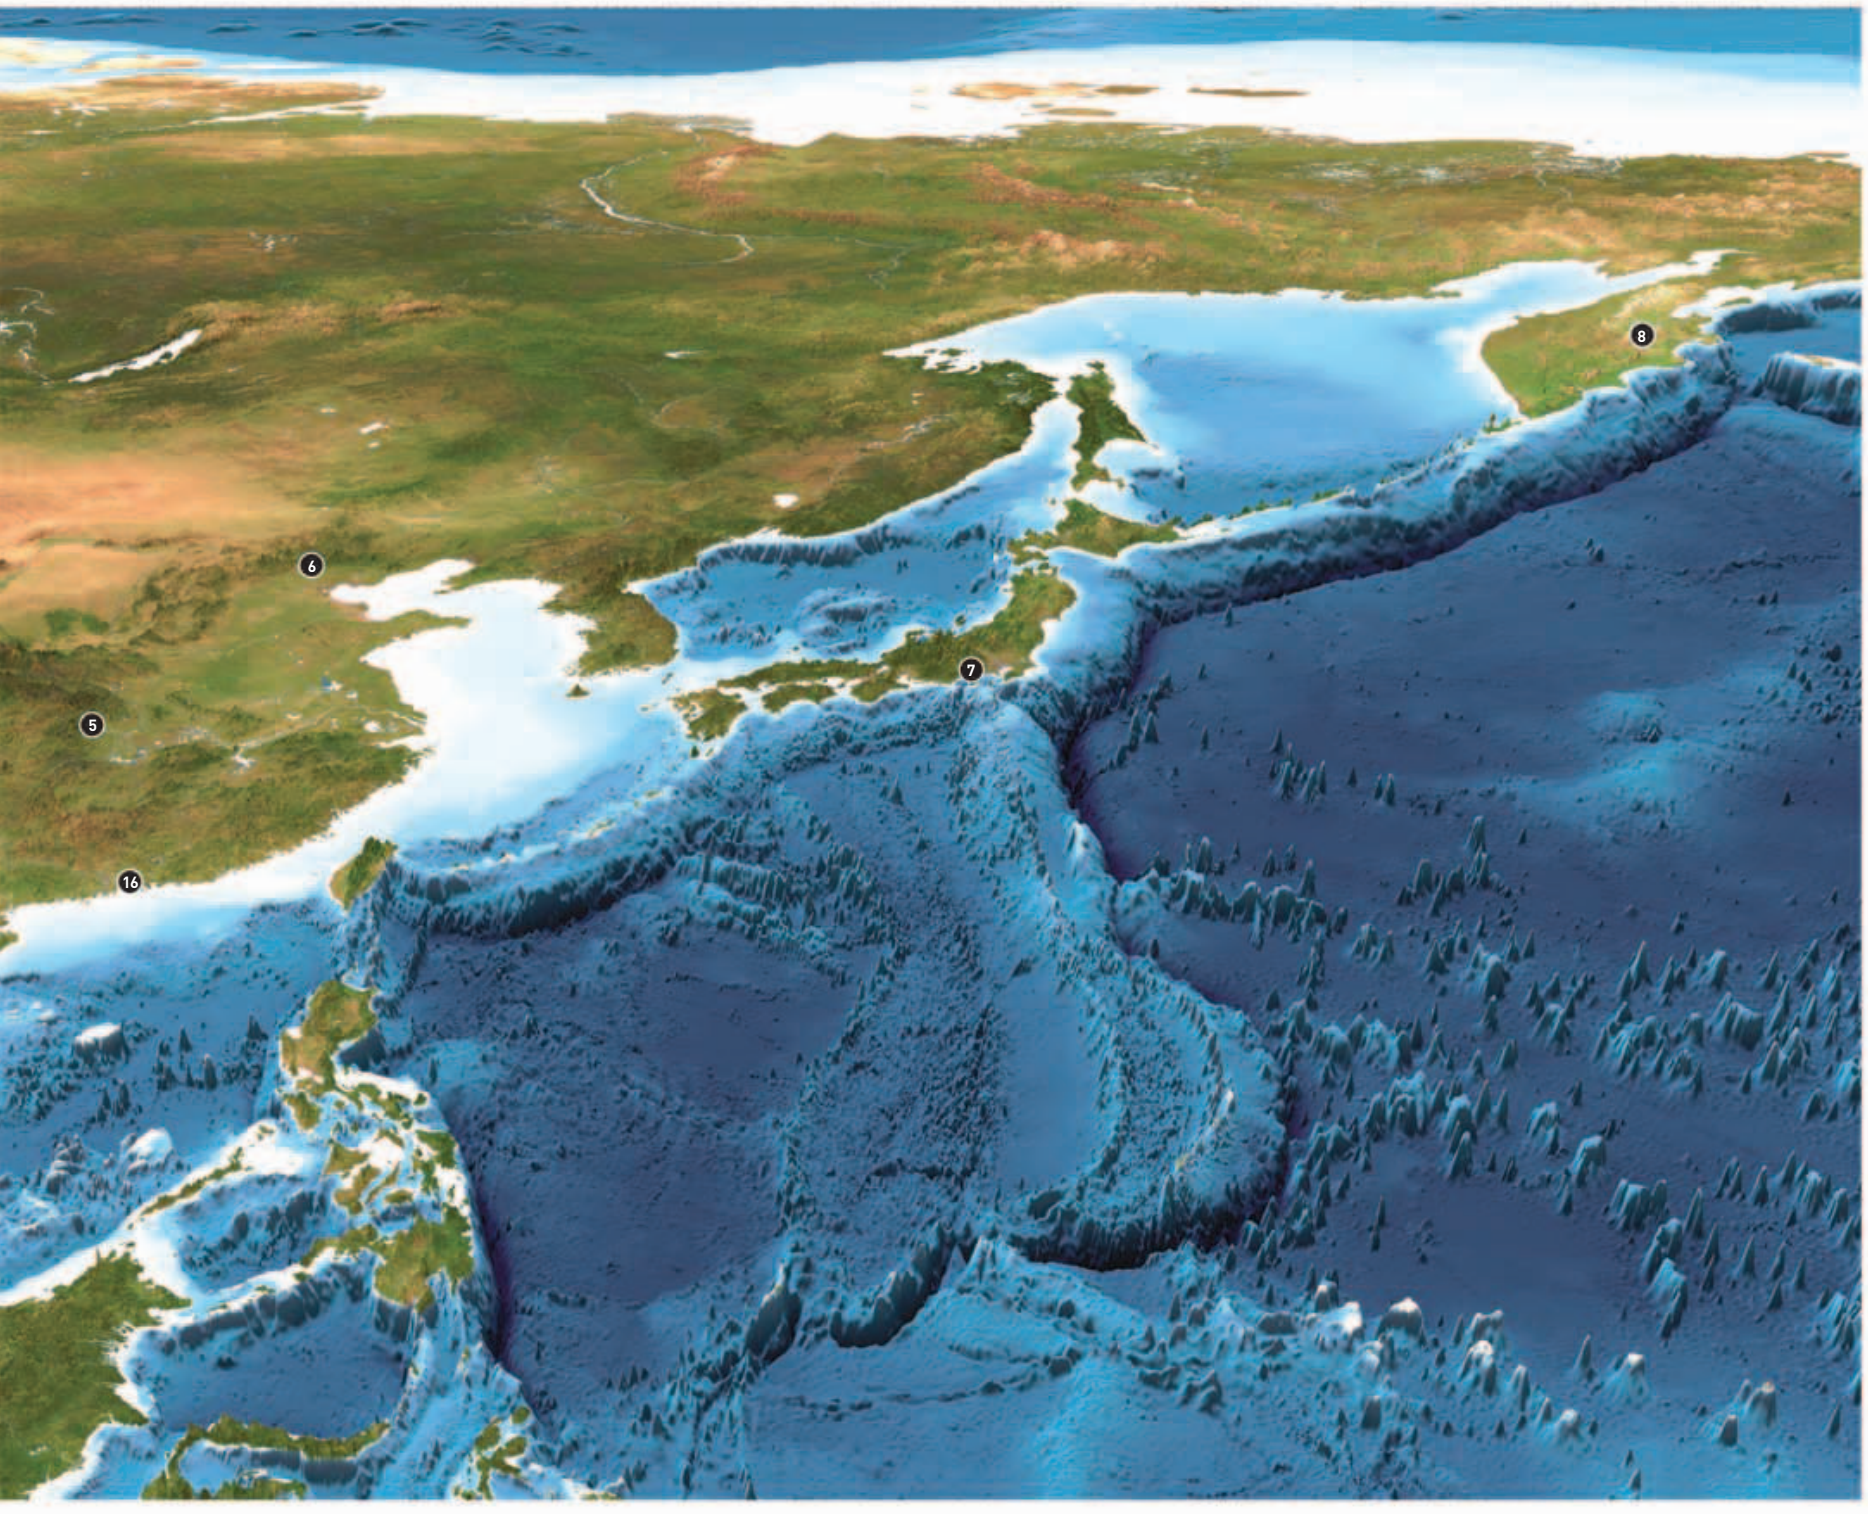
5 THREE GORGES DAM, CHINA
Seen here during its construction in 2000, the world's largest dam is designed to tame the Yangtze river which has regularly flooded.



6 BEIJING, CHINA
China's ancient capital was laid out on a grid pattern centred on the Forbidden City and its streets are picked out in this winter image by snowfall.

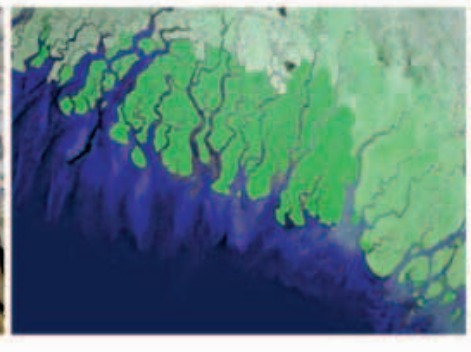
7 MOUNT FUJI, JAPAN
The steep, symmetrical, snow-capped volcano last erupted in 1707.

8 VULKAN KLYUCHEVSKAYA SOPKA, RUSSIAN FEDERATION
The Kamchatka Peninsula's highest and most active volcano last erupted in 1994.

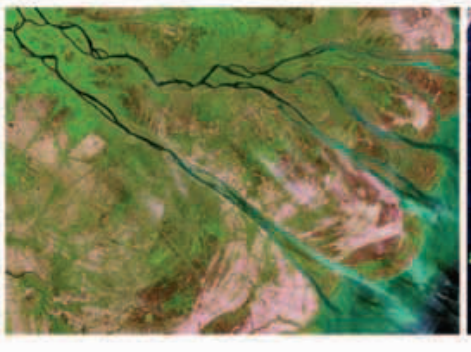


13 MOUNT EVEREST, CHINA/NEPAL
The world's highest mountain at 29,029 ft (8848 m) straddles the border between China and Nepal.

14 MOUTHS OF THE GANGES, BANGLADESH/INDIA
Stretching across the northern end of the Bay of Bengal, this river delta contains the Sundarbans, the world's largest mangrove forest, which appears as a rich green area.



15 MEKONG DELTA, VIETNAM
The Mekong river flows over 2494 miles (4000 km) from the Plateau of Tibet before crossing Vietnam to reach the South China Sea.



16 HONG KONG, CHINA
Handed back to China by the British in 1997, this city remains east Asia's trade and finance center.

AUSTRALASIA & OCEANIA

Australasia and Oceania with a total land area of 3,285,048 sq miles (8,508,238 sq km), takes in 14 countries including the continent of Australia, New Zealand, Papua New Guinea, and many island groups scattered across the Pacific Ocean.

FACTFILE

N Most Northerly Point: Eastern Island, Midway Islands 28° 15' N
S Most Southerly Point: Macquarie Island, Australia 54° 30' S
E Most Easterly Point: Clipperton Island, 109° 12' W
W Most Westerly Point: Cape Inscription, Australia 112° 57' E

Largest Lakes:
1. Lake Eyre, Australia 3430 sq miles (8884 sq km)
2. Lake Torrens, Australia 2200 sq miles (5698 sq km)
3. Lake Gairdner, Australia 1679 sq miles (4349 sq km)
4. Lake Mackay, Australia 1349 sq miles (3494 sq km)
5. Lake Argyle, Australia 800 sq miles (2072 sq km)

Longest Rivers:
1. Murray-Darling, Australia 2330 miles (3750 km)
2. Cooper Creek, Australia 880 miles (1420 km)
3. Warburton-Georgina, Australia 870 miles (1400 km)
4. Sepik, Indonesia/Papua New Guinea 700 miles (1126 km)
5. Fly, Indonesia/Papua New Guinea 652 miles (1050 km)

Largest Islands:
1. New Guinea, 312,000 sq miles (808,000 sq km)
2. South Island, New Zealand 56,308 sq miles (145,836 sq km)
3. North Island, New Zealand 43,082 sq miles (111,583 sq km)
4. Tasmania, Australia 24,911 sq miles (64,519 sq km)
5. New Britain, Papua New Guinea 13,570 sq miles (35,145 sq km)

Highest Points:
1. Mount Wilhelm, Papua New Guinea 14,793 ft (4509 m)
2. Mount Giluwe, Papua New Guinea 14,331 ft (4368 m)
3. Mount Herbert, Papua New Guinea 13,999 ft (4267 m)
4. Mount Bangeta, Papua New Guinea 13,520 ft (4121 m)
5. Mount Victoria, Papua New Guinea 13,360 ft (4072 m)

Lowest Point:
▼ Lake Eyre, Australia -53 ft (-16 m) below sea level

Highest recorded temperature:
+ Bourke, Australia 128°F (53°C)

Lowest recorded temperature:
− Canberra, Australia -8°F (-22°C)

Wettest Place:
≋ Bellenden Ker, Australia 443 in (11,251 mm)

Driest Place:
— Mulka Bore, Australia 4.05 in (102.8 mm)

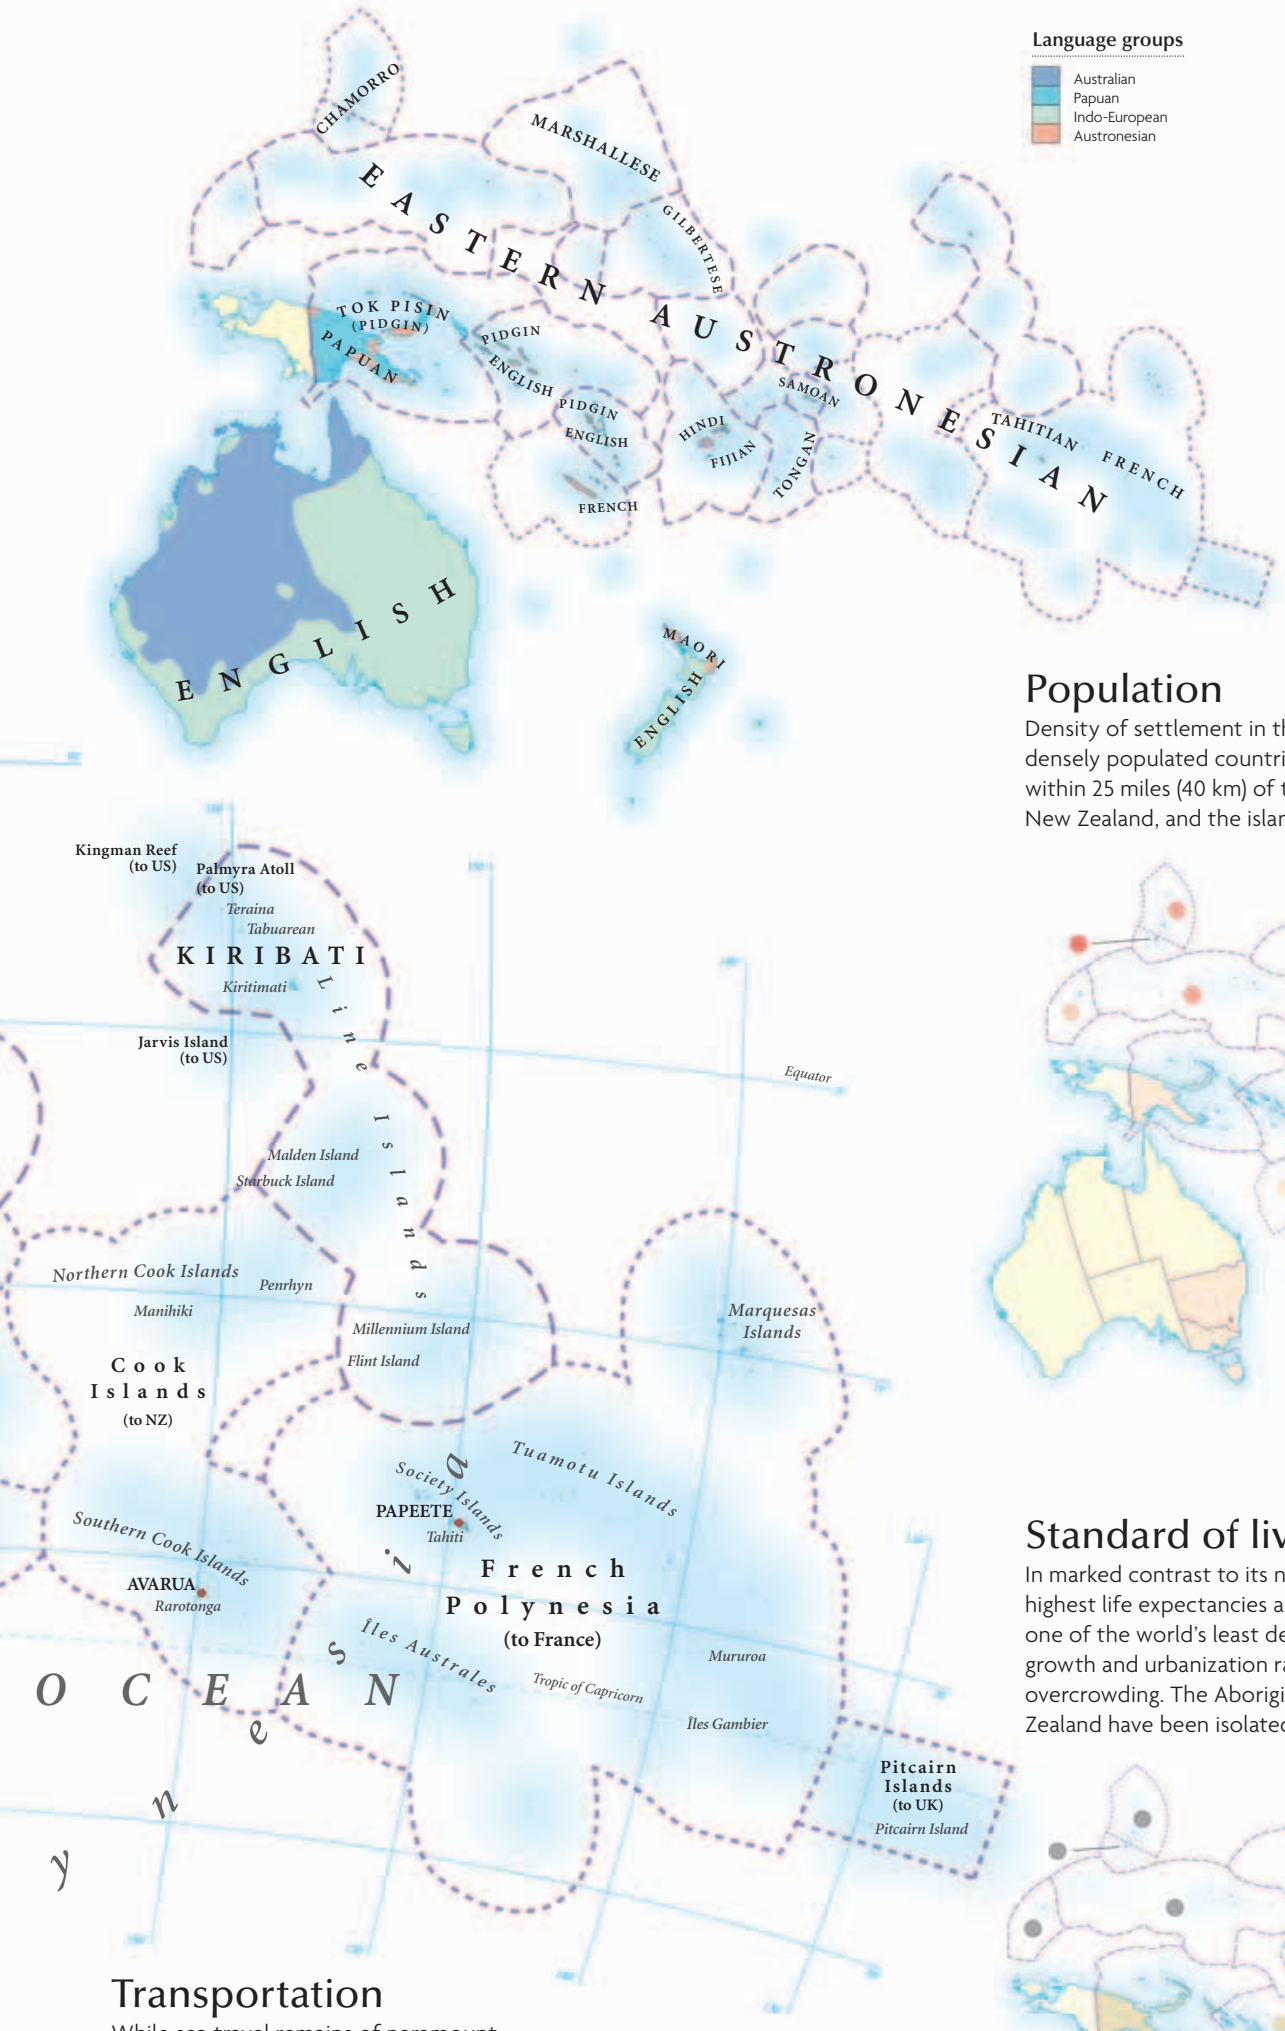
Political

Vast expanses of ocean separate this geographically fragmented realm, characterized more by each country's isolation than by any political unity. Australia's and New Zealand's traditional ties with the United Kingdom, as members of the Commonwealth, are now being called into question as Australasian and Oceanian nations are increasingly looking to forge new relationships with neighboring Asian countries like Japan. External influences have featured strongly in the politics of the Pacific Islands; the various territories of Micronesia were largely under US control until the late 1980s, and France, New Zealand, the USA and the UK still have territories under colonial rule in Polynesia. Nuclear weapons-testing by Western superpowers was widespread during the Cold War period, but has now been discontinued.

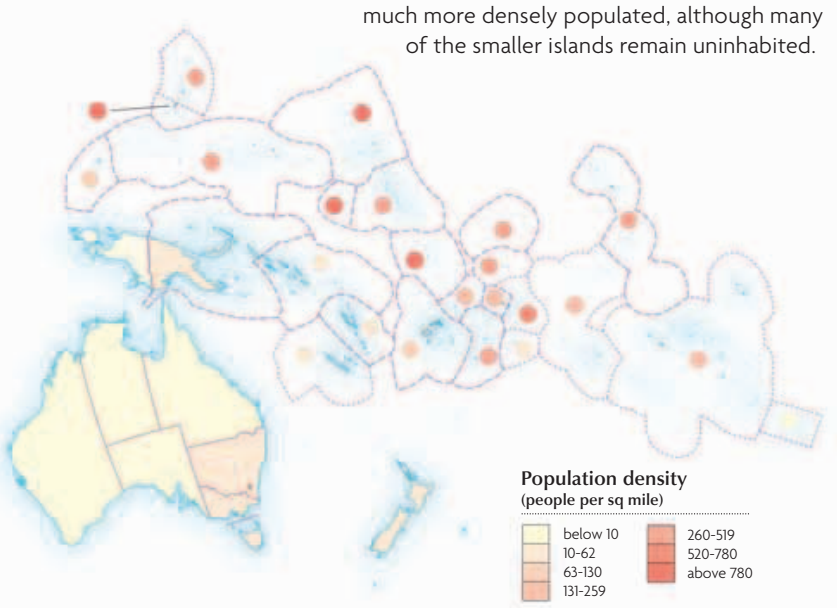


Languages

English is spoken throughout Australia and New Zealand. In Australia, English has been superimposed on a mosaic of Aboriginal languages. In New Zealand, the indigenous language, Maori, is the official language besides English. In Papua New Guinea, Melanesian Pidgin has become a *lingua franca* alongside several hundred indigenous languages. Across the region, the indigenous languages can be grouped into (1) the Aboriginal languages of Australia, (2) the Papuan languages spoken mostly inland in Papua New Guinea, and (3) the widely dispersed Austronesian, which includes coastal languages of Papua New Guinea, New Zealand Maori, and languages of Oceania.

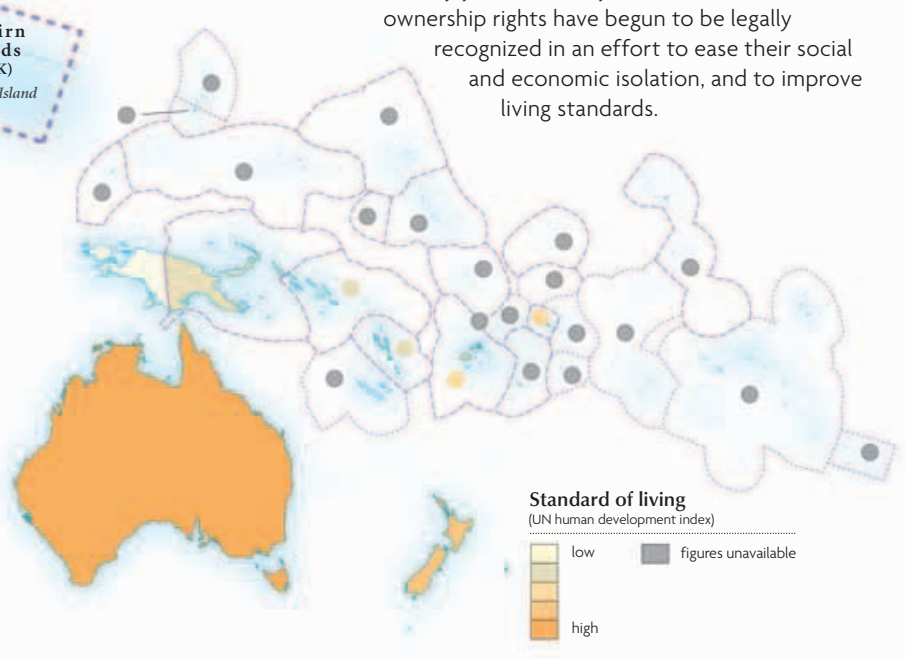
Population

Density of settlement in the region is generally low. Australia is one of the least densely populated countries on Earth with over 80% of its population living within 25 miles (40 km) of the coast – mostly in the southeast of the country. New Zealand, and the island groups of Melanesia, Micronesia and Polynesia, are much more densely populated, although many of the smaller islands remain uninhabited.



Standard of living

In marked contrast to its neighbor, Australia, with one of the world's highest life expectancies and standards of living, Papua New Guinea is one of the world's least developed countries. In addition, high population growth and urbanization rates throughout the Pacific islands contribute to overcrowding. The Aboriginal and Maori people of Australia and New Zealand have been isolated for many years. Recently, their traditional land ownership rights have begun to be legally recognized in an effort to ease their social and economic isolation, and to improve living standards.



Transportation

While sea travel remains of paramount importance throughout the continent, well-developed regional and international air travel has reduced the region's global isolation. Internal air travel is particularly important in Australia, where distances are great and road systems are poorly developed or in some areas nonexistent. Australia's rail system, still operating on three different guages, a legacy of its piecemeal development, is being upgraded, particularly in the north-south links.

PACIFIC OCEAN

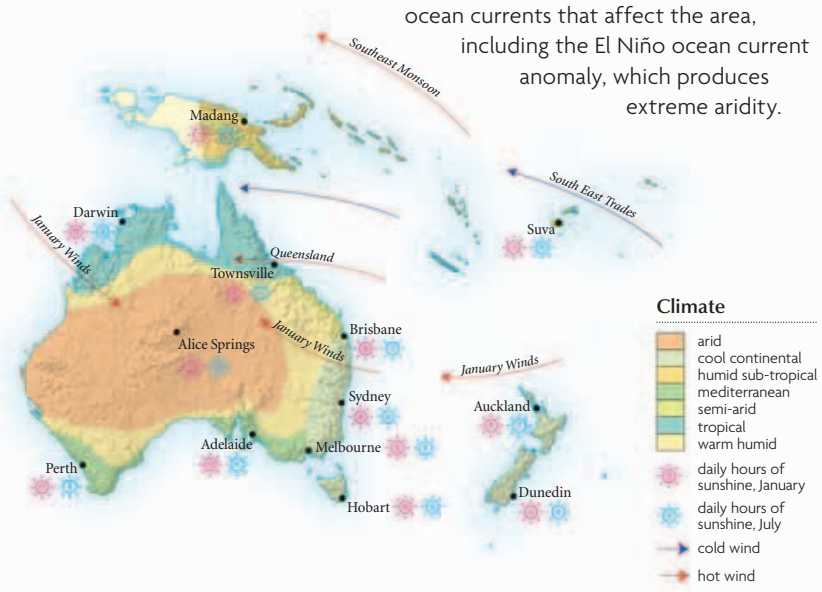
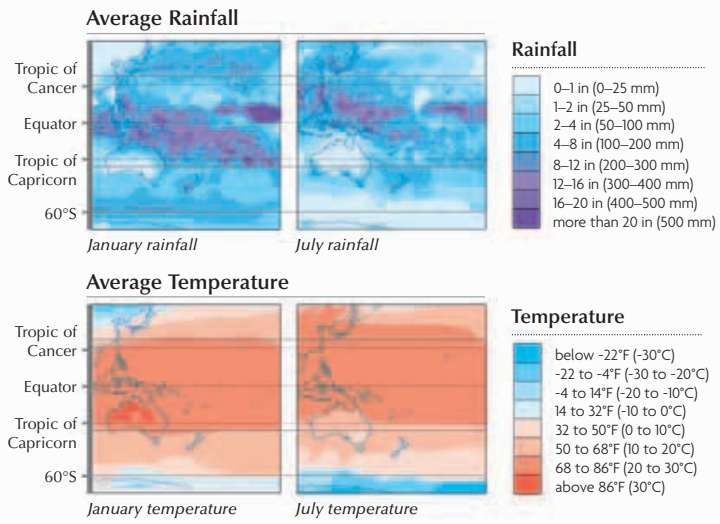
Climate

Surrounded by water, the climate of most areas is profoundly affected by the moderating effects of the oceans. Australia, however, is the exception. Its dry continental interior remains isolated from the ocean; temperatures soar during the day, and droughts are common. The coastal regions, where most people live, are cooler and wetter. The numerous islands scattered across the Pacific are generally hot and humid, subject to the different air circulation patterns and ocean currents that affect the area, including the El Niño ocean current anomaly, which produces extreme aridity.



Land use

Much of the region's industry is resource-based: sheep farming for wool and meat in Australia and New Zealand; mining in Australia and Papua New Guinea and fishing throughout the Pacific islands. Manufacturing is mainly limited to the large coastal cities in Australia and New Zealand, like Sydney, Adelaide, Melbourne, Brisbane, Perth, and Auckland, although small-scale enterprises operate in the Pacific islands, concentrating on processing of fish and foods. Tourism continues to provide revenue to the area—in Fiji it accounts for 15 percent of GNP.



Environmental issues

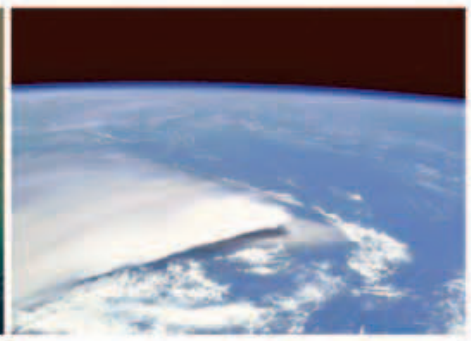
The prospect of rising sea levels poses a threat to many low-lying islands in the Pacific. Nuclear weapons-testing, once common throughout the region, was finally discontinued in 1996. Australia's ecological balance has been irreversibly altered by the introduction of alien species. Although it has the world's largest underground water reserve, the Great Artesian Basin, the availability of fresh water in Australia remains critical. Periodic droughts combined with over-grazing lead to desertification and increase the risk of devastating bush fires, and occasional flash floods.

AUSTRALASIA & OCEANIA

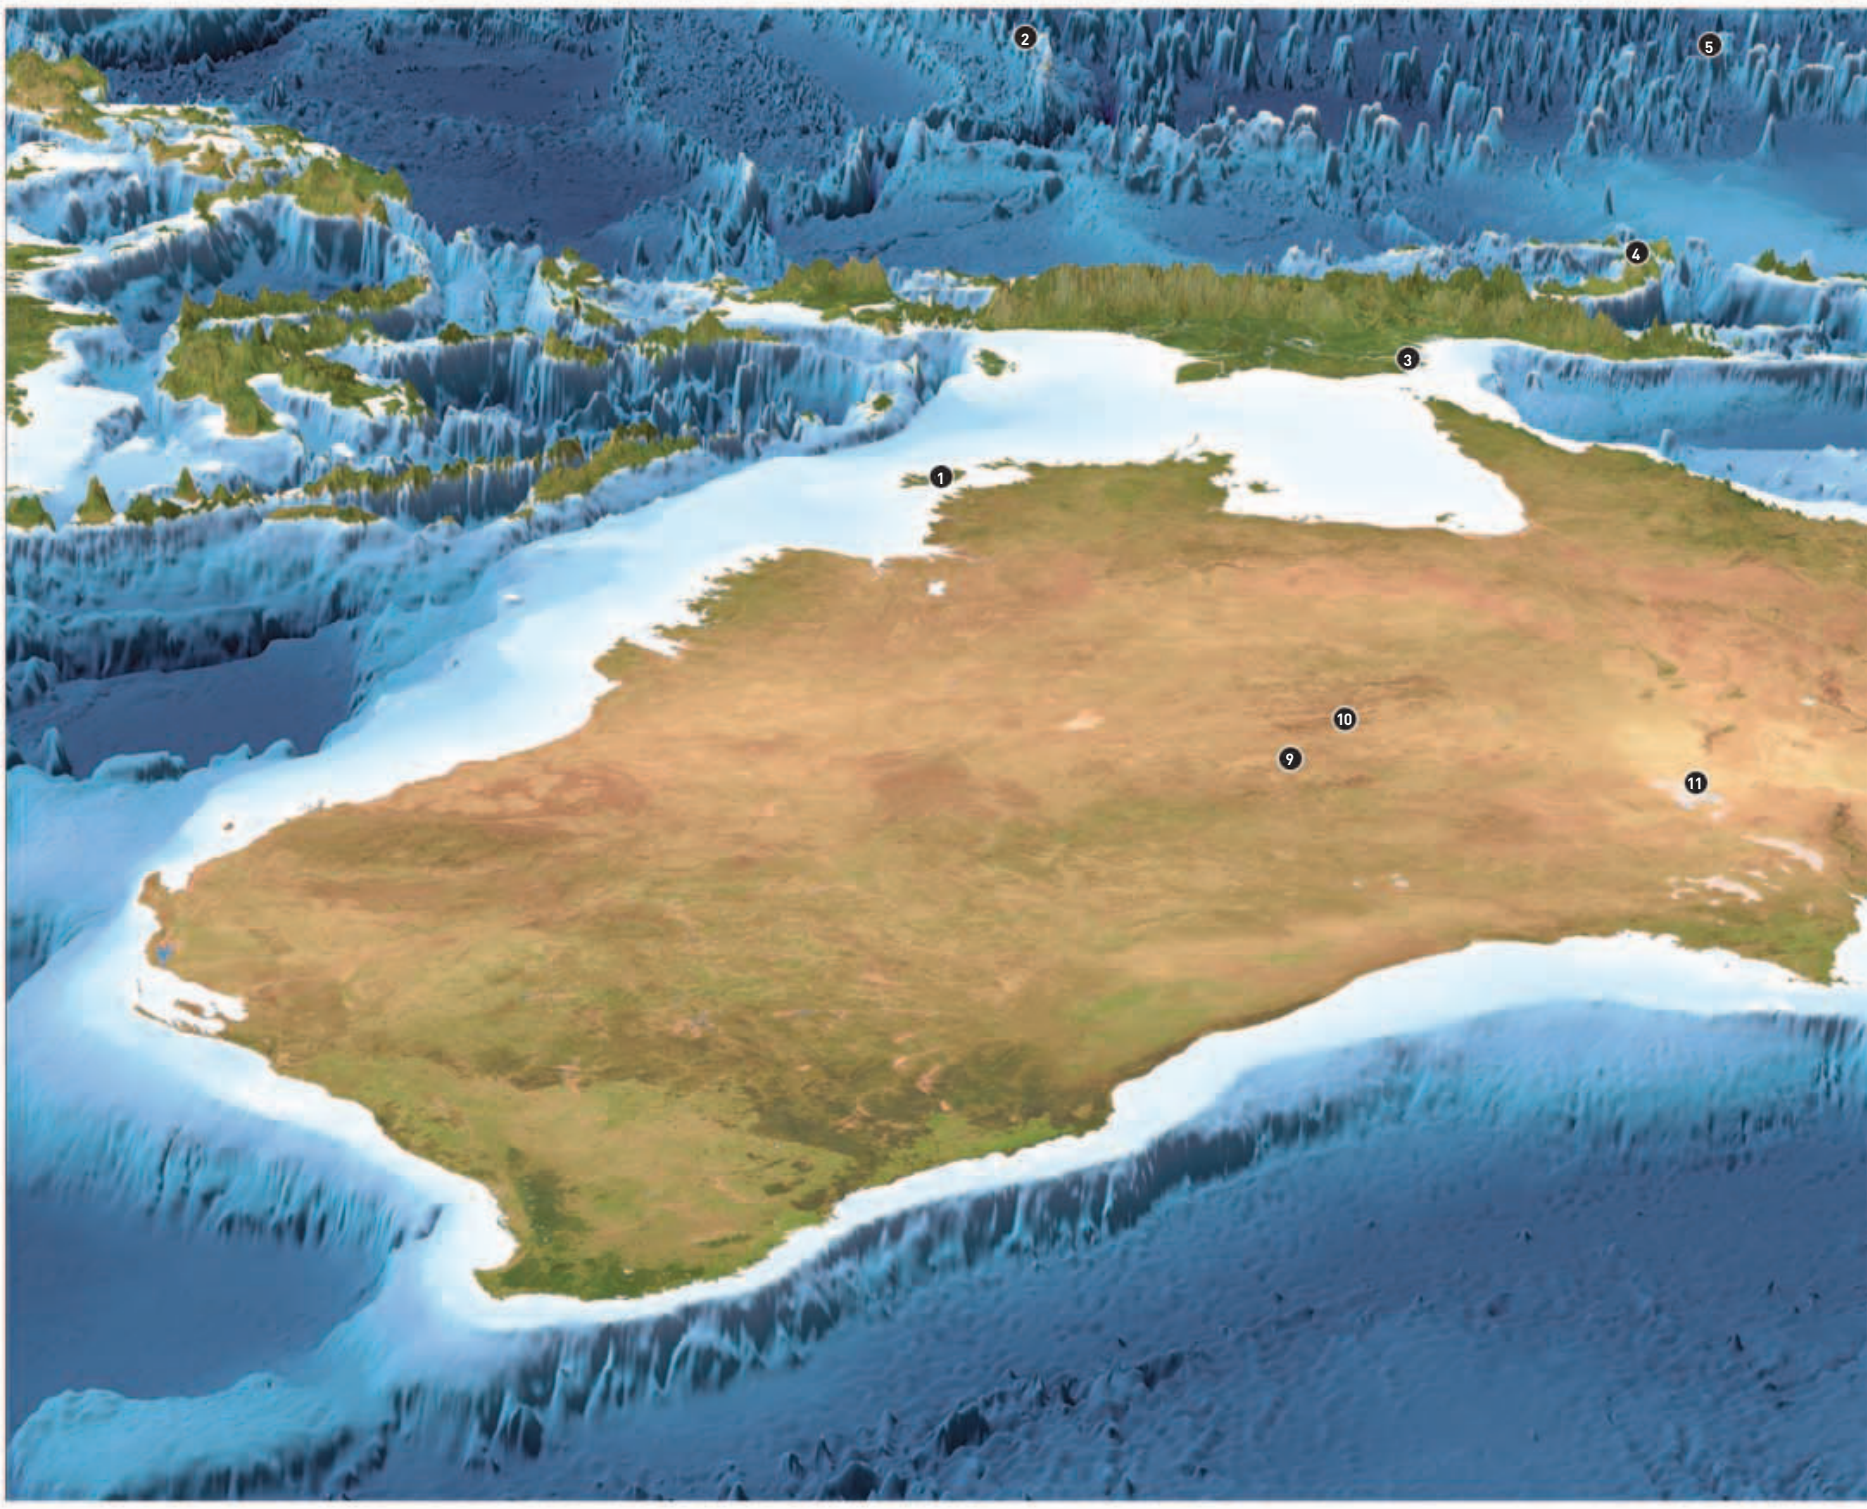
1 MELVILLE ISLAND, NORTHERN TERRITORY, AUSTRALIA
Lying off Australia's north coast, the island is sparsely populated consisting of sandy soils and mangrove swamps.

2 ANATAHAN, NORTHERN MARIANA ISLANDS
The volcano on Anatahan is one of 12 in the Mariana Islands and erupted on a large scale in April 2005.

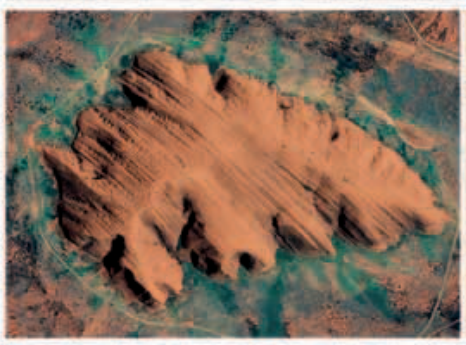
3 FLY RIVER, PAPUA NEW GUINEA
Flowing down from New Guinea's Central Range, the river carries a heavy load of sediment which it deposits in the Gulf of Papua, sometimes forming new islands.



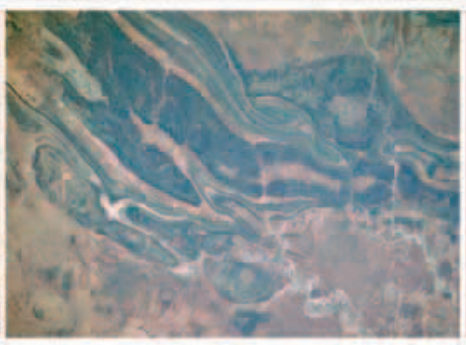
4 RABAUL VOLCANO, NEW BRITAIN, PAPUA NEW GUINEA
After erupting in 1994, this image shows how the highest particles blew west causing condensation of water vapor over a wide area.



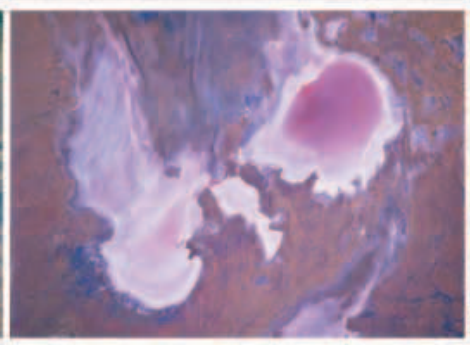
9 ULURU/AYERS ROCK,
NORTHERN TERRITORY, AUSTRALIA
This enormous sandstone rock occupies Australia's heart, both physically and emotionally.



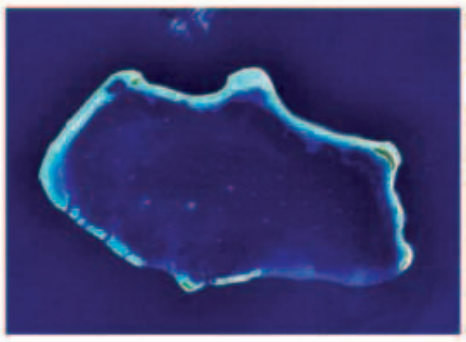
10 JAMES RANGES, NORTHERN TERRITORY, AUSTRALIA
A series of low ridges, these hills lie at the geographical center of Australia.



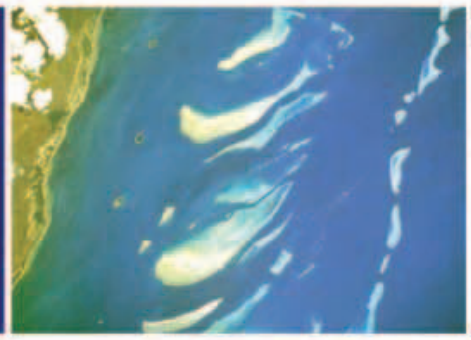
11 LAKE EYRE, SOUTH AUSTRALIA, AUSTRALIA
This great salt lake consists of north and south sections, joined by a narrow channel, Lake Eyre South being the smaller, elongated saltflat at the bottom of the image.



12 NEWCASTLE, NEW SOUTH WALES, AUSTRALIA
The industrial seaport of Newcastle lies on the south bank of Hunter river.



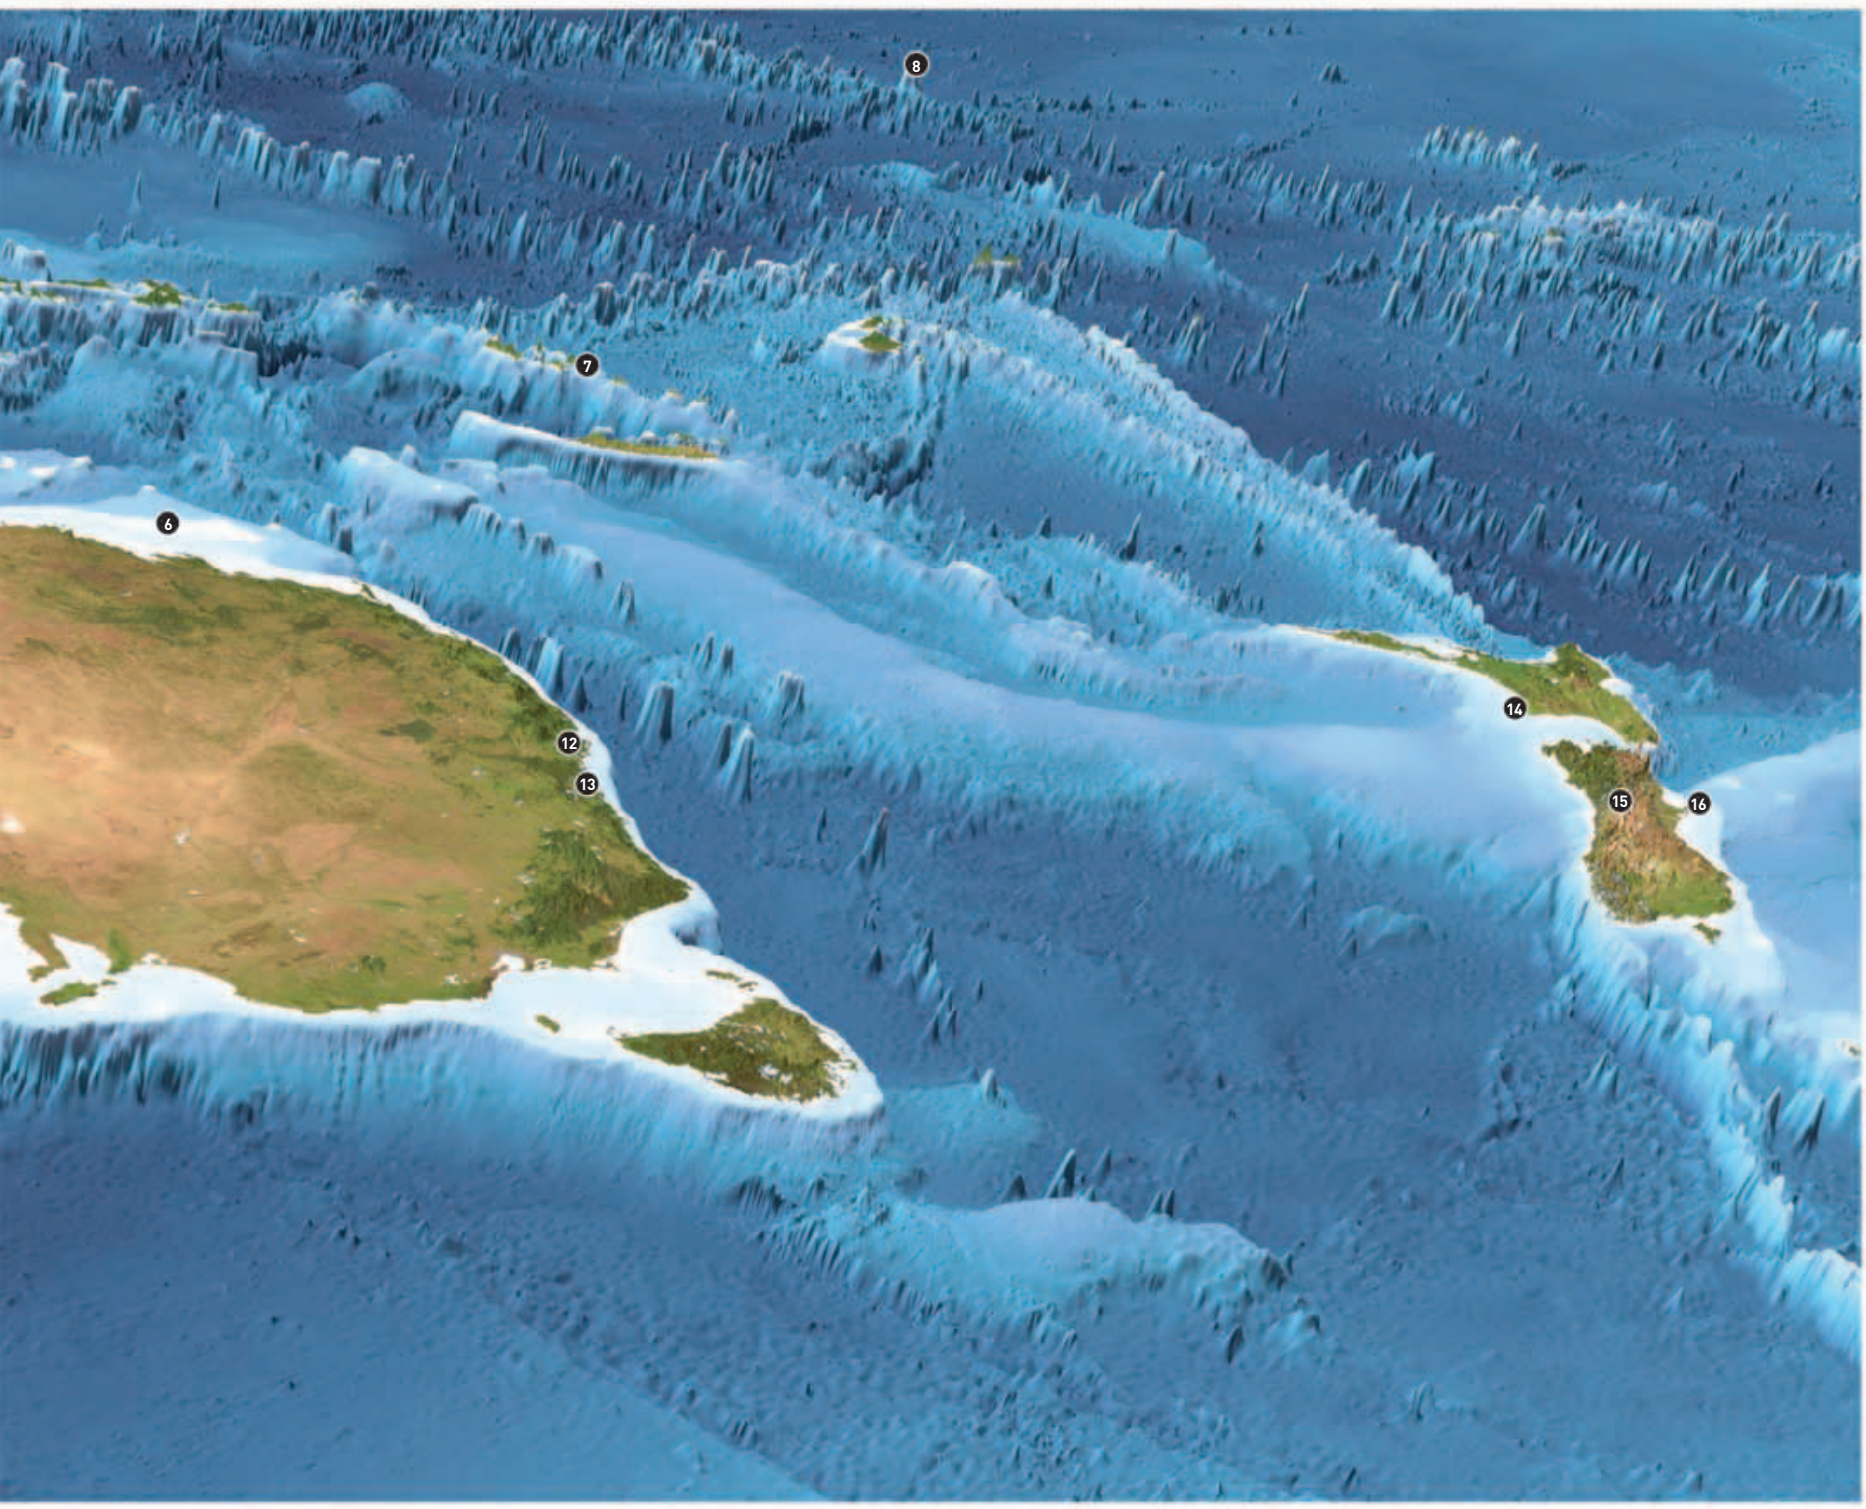
BIKINI ATOLL, MARSHALL ISLANDS 5
This atoll was the site of 23 atomic bomb tests in the 1940s and 1950s, involving the intentional sinking of at least 13 naval vessels in the shallow lagoon.



GREAT BARRIER REEF, QUEENSLAND, AUSTRALIA 6
The world's largest reef system is made up of 3000 individual reefs and 900 islands and stretches for 1600 miles (2600 km).

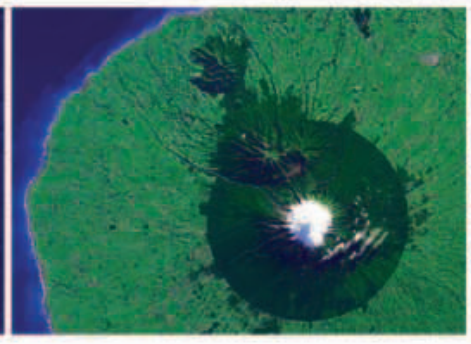
AMBRYM, VANUATU 7
Mount Marum, a 4166 ft (1270 m) volcano, erupted in April 2004 producing an extensive plume of ash.

KIRITIMATI, KIRIBATI 8
Kiritimati is the largest atoll in the Pacific Ocean, its interior lagoon filled in with coral growth.



SYDNEY, NEW SOUTH WALES, AUSTRALIA 13
Expanding outward from the inlet of Port Jackson, Australia's largest city was founded in 1788.

MOUNT TARANAKI, NORTH ISLAND, NEW ZEALAND 14
This dormant 2518 m (8261 ft) volcano is one of the most symmetrical in the world.



AORAKI/MOUNT COOK, SOUTH ISLAND, NEW ZEALAND 15
New Zealand's highest peak rises 12,238 ft (3744 m) and is surrounded by permanent ice fields.

BANKS PENINSULA, SOUTH ISLAND, NEW ZEALAND 16
With a circular drainage pattern typical of eroded volcanoes, this is the only recognizably volcanic feature on New Zealand's South Island.

Mackenzie (Canada)	2640 miles	(4250 km)
Yenisey (Russian Federation)	2541 miles	(4090km)

Highest mountains

Height above sea level

Everest	29,029 ft	(8848 m)
K2	28,253 ft	(8611 m)
Kangchenjunga	28,210 ft	(8598 m)
Lhotse	27,940 ft	(8516 m)
Makalu	27,767 ft	(8463 m)
Cho Oyu	26,907 ft	(8201 m)
Dhaulagiri	26,796 ft	(8167 m)
Manaslu	26,783 ft	(8163 m)
Nanga Parbat	26,661 ft	(8126 m)
Annapurna	26,547 ft	(8091 m)

Largest bodies of inland water

With area and depth

Caspian Sea	143,243 sq miles (371,000 sq km)	3215 ft (980 m)
Lake Superior	31,151 sq miles (83,270 sq km)	1289 ft (393 m)
Lake Victoria	26,828 sq miles (69,484 sq km)	328 ft (100 m)
Lake Huron	23,436 sq miles (60,700 sq km)	751 ft (229 m)
Lake Michigan	22,402 sq miles (58,020 sq km)	922 ft (281 m)
Lake Tanganyika	12,703 sq miles (32,900 sq km)	4700 ft (1435 m)
Great Bear Lake	12,274 sq miles (31,790 sq km)	1047 ft (319 m)
Lake Baikal	11,776 sq miles (30,500 sq km)	5712 ft (1741 m)
Great Slave Lake	10,981 sq miles (28,440 sq km)	459 ft (140 m)
Lake Erie	9,915 sq miles (25,680 sq km)	197 ft (60 m)

Deepest ocean features

Challenger Deep, Mariana Trench (Pacific)	36,201 ft	(11,034 m)
Vityaz III Depth, Tonga Trench (Pacific)	35,704 ft	(10,882 m)
Vityaz Depth, Kurile-Kamchatka Trench (Pacific)	34,588 ft	(10,542 m)
Cape Johnson Deep, Philippine Trench (Pacific)	34,441 ft	(10,497 m)
Kermadec Trench (Pacific)	32,964 ft	(10,047 m)
Ramapo Deep, Japan Trench (Pacific)	32,758 ft	(9984 m)
Milwaukee Deep, Puerto Rico Trench (Atlantic)	30,185 ft	(9200 m)
Argo Deep, Torres Trench (Pacific)	30,070 ft	(9165 m)
Meteor Depth, South Sandwich Trench (Atlantic)	30,000 ft	(9144 m)
Planet Deep, New Britain Trench (Pacific)	29,988 ft	(9140 m)

Greatest waterfalls

Mean flow of water

Boyoma (Congo, Dem. Rep.)	600,400 cu. ft/sec	(17,000 cu.m/sec)
Khône (Laos/Cambodia)	410,000 cu. ft/sec	(11,600 cu.m/sec)

Conakry (Guinea)	171 in	(4341 mm)

Countries of the World

There are currently 196 independent countries in the world – more than at any previous time – and almost 60 dependencies. Antarctica is the only land area on Earth that is not officially part of, and does not belong to, any single country.

In 1950, the world comprised 82 countries. In the decades following, many more states came into being as they achieved independence from their former colonial rulers. Most recent additions were caused by the breakup of the former Soviet Union in 1991, and the former Yugoslavia in 1992, which swelled the ranks of independent states. In July 2011, South Sudan became the latest country to be formed after declaring independence from Sudan.

Country factfile key

Formation Date of independence / date current borders were established

Population Total population / population density – based on total *land* area

Languages An asterisk (*) denotes the official language(s)

Calorie consumption Average number of calories consumed daily per person

AFGHANISTAN
Central Asia

Official name Islamic Republic of Afghanistan
Formation 1919 / 1919
Capital Kabul
Population 29.1 million / 116 people per sq mile (45 people per sq km)

Geographical names

The following glossary lists geographical terms occurring on the maps and in main-entry names in the Index-Gazetteer. These terms may precede, follow or be run together with the proper element of the name; where they precede it the term is reversed for indexing purposes - thus Poluostrov Yamal is indexed as Yamal, Poluostrov.

Key

Geographical term
Language, Term

A

Å *Danish, Norwegian*, River
Āb *Persian*, River
Adrar *Berber*, Mountains
Agía, Ágios *Greek*, Saint
Air *Indonesian*, River
Ákra *Greek*, Cape, point

UAE United Arab Emirates
Uigh. Uighur
UK United Kingdom
Ukr. Ukrainian
UN United Nations
Urd. Urdu
US/USA United States of America
USSR Union of Soviet Socialist Republics
Uzb. Uzbek

V

var. variant
Vdkhr. Vodokhranilishche (Russian for reservoir)
Vdskh. Vodoskhovyshche (Ukrainian for reservoir)
Vtn. Vietnamese

W

W west
Wel. Welsh

Y

Yugo. Yugoslavia

This index lists all the placenames and features shown on the regional and continental maps in this Atlas. Placenames are referenced to the largest scale map on which they appear. The policy followed throughout the Atlas is to use the local spelling or local name at regional level; commonly-used English language names may occasionally be added (in parentheses) where this is an aid to identification e.g. Firenze (Florence). English names, where they exist, have been used for all international features e.g. oceans and country names; they are also used on the continental maps and in the introductory World section; these are then fully cross-referenced to the local names found on the regional maps. The index also contains commonly-found alternative names and variant spellings, which are also fully cross-referenced.

All main entry names are those of settlements unless otherwise indicated by the use of italicized definitions or representative symbols, which are keyed at the foot of each page.
